

SUMMER– 2018 EXAMINATION
Model Answer

Subject Code:

17208

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

| Q. No. | Sub Q. N. | Answer | Marking Scheme |
|-----------|------------|--|----------------|
| 1. | | Attempt any nine of the following: | 18 |
| | (a) | Define i) flux ii) Slag | 2 |
| | | i) Flux: The substance which is used to remove the gangue during the smelting process is known as flux. | 1 |
| | | ii) Slag: Flux reacts with gangue to form some fusible mass known as Slag. | 1 |
| | (b) | Write the names of any two different zones of blast furnace with their temperature. | 2 |
| | | Different zones of blast furnace with their temperature are as follows: | 1 |
| | | i) Zone of reduction (300-800 ⁰ c i.e.dull red heat) | 1 |
| | | ii) Zone of heat absorption (800-1200 ⁰ c i.e.bright red heat) | 1 |
| | | iii) Zone of fusion (1200-1500 ⁰ c i.e. white heat) | 1 |
| | | (any two zones-1 mark each) | 1 |

SUMMER- 2018 EXAMINATION
Model Answer

17208

| Q. No. | Sub Q. N. | Answer | Marking Scheme | |
|--------|-----------|---|---------------------------------|--|
| 1. | (c) | What are the types of heat treatment methods? Methods of heat treatment :- 1. Hardening or quenching 2. Tempering 3. Annealing 4. Normalizing | 2 ½ mark each | |
| | (d) | Define corrosion. State its two main types. Corrosion: The process of chemical or electrochemical decay or destruction of a metal due to the action of surrounding medium is called as corrosion. Types: i) Atmospheric corrosion or Direct chemical corrosion or Dry corrosion. ii) Immersed corrosion or electro chemical corrosion or Wet corrosion. | 2 1 1/2 mark each | |
| | (e) | Define Paint. Write the names of any two constituents of paint. Paint: Paint is a mechanical dispersion mixture of one or more pigments in a vehicle. Constituents of paint: (Any two) 1) Pigments 2) Drying Oil / Medium 3) Thinners 4) Driers 5) Extenders 6) Plasticizers | 2 1 ½ mark each | |
| | (f) | Why galvanised containers are not used for storage of food? Explain. Galvanized container contains zinc coating. Since Zn is more active metal it readily reacts with the acids present in the food stuffs forming Zn compounds which are highly poisonous & it may poison the food stuffs. Therefore galvanized containers can not be used for storing food stuff. | 2 2 | |
| | | | | |
| | | | | |

SUMMER– 2018 EXAMINATION

17208

| Q. No. | Sub Q. N. | Answer | Marking Scheme |
|--------|-----------|---|----------------|
| 1 | (g) | Give one advantage and one disadvantage of metal cladding. | 2 |
| | | Advantages: (Any One) | |
| | | 1. To develop surface properties like corrosion resistance in steel sheets. | 1 |
| | | 2. To produce combining advantage of strength due to steel wire and electrical conductivity due to copper by producing copper-cladded steel wire. | |
| | | 3. By producing alclad sheets (i.e.aluminium is cladded on duralumin sheets), the light and strong alloy required in air-craft industry can be obtained. | |
| | | 4.The cladding metal (i.e.coating metal) provides the electrolytic protection for the base metal. | |
| | | Disadvantages : (Any One) | |
| | | 1.By metal cladding only plain surfaces can be protected. | 1 |
| | | 2.Cladding is not perfect, the irregular surfaces provide galvanic cell action in the presence of moisture. Hence, the corrosion cannot be absolutely prevented by this method. | |
| | (h) | List the common types of impurities present in the water | 2 |
| | | i) Suspended impurities | |
| | | ii) Dissolved impurities | ½ mark |
| | | iii) Colloidal impurities | each |
| | | iv) Biological impurities | |
| | (i) | Write any two advantages of zeolite process for water purification. | 2 |
| | | Advantages: (Any Two) | |
| | | i. Water having zero hardness can be obtained. | |
| | | ii. Equipment used is compact. | |
| | | iii. It is a clean process as no impurities are precipitated. | 1 mark |
| | | iv. It requires less time. | each |

| | (c) | <p>What is tempering? Why steel is tempered after quenching? What are its effects on steel?</p> <p>Tempering :</p> <p>“ Tempering is the process of reheating the hardened or quenched steel to a definite temperature (generally below 200-600⁰c) and then cooling it at a suitable rate.”</p> <p>Reason:</p> <p>By quenching, the hardness of the steel is increased but it becomes very brittle and liable to crack while in use. To minimize this defect, steel is tempered.</p> | 4 1 1 | | | | | | | | | | |

SUMMER- 2018 EXAMINATION

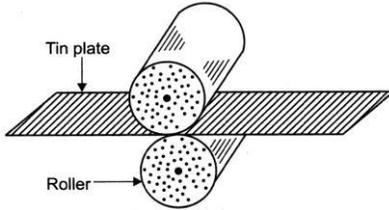

17208

Model Answer

| Q. No. | Sub Q. N. | Answer | Marking Scheme |
|--------|-----------|---|--|
| 2. | | <p>Effects on steel : (Any two)</p> <ol style="list-style-type: none"> 1.The properties like hardness, brittleness and internal stresses developed in a quenched steel are reduced. 2.It imparts toughness and elasticity to steel. 3.It improves ductility of metal. <p>(d) Explain hydrogen evolution mechanism of electrochemical corrosion.</p>  <p>Steel tank: - Anode Cu – strip:- Cathode</p> <p>These types of corrosion occur usually in acidic environments like industrial waste, solutions of non – oxidizing acids. Consider a steel tank containing acidic industrial waste and small piece of copper scrap in contact with steel. The portion of the steel tank in contact with copper acts as anode & is corroded most with the evolution of hydrogen gas.</p> <p>Reactions: At Anode: Fe \longrightarrow Fe⁺⁺ + 2 e⁻ (Oxidation)</p> <p>These electrons flow through the metal from anode to the cathode that is piece of copper metal where they are accepted by H⁺ ions to form H₂ gas</p> <p>At cathode : H⁺ ions are eliminated as H₂ gas 2H⁺ + 2 e⁻ \longrightarrow H₂ (Reduction)</p> <p>Thus, over all reaction is Fe + 2H⁺ \longrightarrow Fe⁺⁺ + H₂</p> | <p>2</p> <p>4</p> <p>1</p> <p>1</p> <p>1</p> |

Model Answer

| Q. No. | Sub Q. N. | Answer | Marking Scheme |
|--------|-----------|--|------------------|
| 2. | (e) | <p>Name the types of oxide films formed in atmospheric corrosion with examples. Which oxide film is more protective? Why?</p> <p>Types of oxide films :</p> <p>a) Porous (Non-protective)</p> <p>b) Nonporous (Protective)</p> <p>c) Unstable film</p> <p>d) Volatile film</p> <p>Non – Porous oxide film is protective. Reason: In Non – Porous oxide film, volume of oxide is greater than the volume of metal. Due to absence of any pores in the oxide film, it forms a protective layer and hence the rate of corrosion of metal rapidly decreases.</p> <p>Unstable oxide film is protective. Reason: As soon as the film is formed it decomposes to give original metal again. Therefore corrosion is not possible here. (Note: Any one of these film can be considered)</p> | 4 2 2 |
| | (f) | <p>Describe the process of metal cladding with suitable diagram.</p> <p>Definition: Metal cladding involves bonding firmly and permanently a dense, homogeneous layer of a coating metal to the base metal on one or both sides.</p> <p>Process:</p> <p>i) The base metal is sandwiched or cladded between the two sheets of coating metal.</p> <p>ii) This sandwich is then passed through two heavy rollers maintained at high temperature & pressure.</p> <p>iii) Cladded metal is cathodic with respect to the base metal so that electrolytic protection is provided.</p> <div style="text-align: center;"><p>The diagram illustrates the metal cladding process. It shows a horizontal sheet of metal, labeled 'Tin plate', being fed between two rollers. The rollers are labeled 'Roller'. The sheet is being rolled into a cylindrical shape, demonstrating how the base metal is sandwiched between two layers of coating metal.</p></div> <p>OR</p> | 4 1 1 2 |

Model Answer

| Q. No. | Sub Q. N. | Answer | Marking Scheme |
|--------|-----------|--|----------------------------|
| 3. | (b) | <p>Write down any two physical characteristics and any two chemical characteristics of water.</p> <p>Physical characteristics: (Any two)</p> <ol style="list-style-type: none">1. Pure water is colourless, odourless and tasteless.2. Its density at 20⁰c is 0.998 and maximum density is 1 at 4⁰c.3. Its freezing point is 0⁰c and boiling point is 100⁰c.4. Water has a solvent action on many substances and it is therefore called a 'universal solvent'.5. It is neutral to litmus.6. Its latent heat of fusion is 79.7 cal/gm and latent heat of vaporization is 539 cal/gm.7. Its surface tension at 20⁰c is 72.8 dyne/cm and its refractive index is 1.333.8. Its viscosity at 20⁰c is 10.09 millipoise.9. Its dissociation constant at 25⁰c is 1.0×10^{-14}.10. Pure water is a bad conductor of electricity as it is only very slightly ionized. <p>Chemical characteristics : (Any two)</p> <ol style="list-style-type: none">1. Stability : it is very stable and does not decompose easily. Decomposition of water is not more than 2% even when heated to a high temperature such as 2000⁰c.2. Behaviour with metals: metals like Na, K, Ca, Mg, Fe etc react chemically with water producing their hydroxides or oxides.3. Reactions with metallic and non-metallic oxides: water react with metallic oxides to form bases and with non-metallic oxides to form acids.4. Water of hydration : It combines with many salts during crystallization to form hydrates. E.g. $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$. The water present in the hydrates is called water of hydration or water of crystallization.5. Water as a catalyst: water acts as a effective catalyst in many reactions. Perfectly dry gas invariably fail to react and traces of moisture is enough to produce chemical changes. | <p>4</p> <p>2</p> <p>2</p> |

SUMMER- 2018 EXAMINATION

Model Answer

| Q. No. | Sub Q. N. | Answer | Marking Scheme |
|--------|-----------|--|---------------------|
| 3. | c) | <p>Carbonate hardness = [CaCO₃ equivalent of Mg(HCO₃)₂ + Ca(HCO₃)₂] = [100 + 50] = 150 ppm</p> <p>Noncarbonate hardness =[CaCO₃ equivalent of MgCl₂ + CaCl₂ + CaSO₄] =[100 + 100+ 50] = 250 ppm</p> | 1 1 |
| | (d) | <p>Describe in brief Ion-exchange process for hard water with neat labelled diagram.</p> <p>Ion exchange process: i) Hard water is first passed through the cation exchange resin. It removes all the cations like Ca⁺⁺, Mg⁺⁺ and releases H⁺ ions. $R-H_2 + CaCl_2 \longrightarrow R-Ca + 2HCl$ $R-H_2 + MgSO_4 \longrightarrow R-Mg + H_2SO_4$ Thus water is free from cations but it is acidic.</p> <p>ii) The acidic water is then passed through anion exchange resin where acid is converted into water $R'-(OH)_2 + 2HCl \longrightarrow R'-Cl_2 + 2H_2O$ $R'-(OH)_2 + H_2SO_4 \longrightarrow R'-SO_4 + 2H_2O$ Thus water is free from all cations and anions</p> <p>iv) Finally water is made free from dissolved gases like CO₂, O₂ etc. by passing it through third tower of degasifier</p> | 4 1 1 |
| | | <p>Diagram:</p> | 2 |
