

b)	<b>State the condition for no tension in the column section</b>	
Ans.	<p><b>Condition for no tension in the column section</b></p> <p><math>\sigma_o =</math> Direct stress and <math>\sigma_b =</math> Bending stress</p> <p>,if <math>\sigma_o &gt; \sigma_b</math> the resultant stress is compressive , If <math>\sigma_o = \sigma_b</math> the minimum stress is zero and the maximum stress is <math>2\sigma_o</math>, the stress distribution is compressive . but <math>\sigma_o &lt; \sigma_b</math> the stress is partly compressive and partly tensile. A small tensile stress at the base of a structure may develop tension cracks. Hence for no- tension condition, direct stress should be greater than or equal to bending stress. <math>\sigma_o \geq \sigma_b</math></p> <p><math>P / A = M/Z</math></p> <p><math>P / A = Pxe/Z</math> , <math>e = &lt; Z/A</math> Hence for no –tension condition, eccentricity should be less than <math>Z/A</math></p>	<p><b>01 M</b></p> <p><b>01 M</b></p>
c)	<b>State expression for deflection of simply supported beam carrying point load at midspan.</b>	
Ans.	<p><b>A simply supported beam of span L carrying a central point load F at midspan</b></p>  <p>To find the maximum deflection at mid-span, we set <math>x=L/2</math> in the equation and obtain ,maximum deflection = <math>Y_c</math></p> <p><math>Y_c = Y_{max} = FL^3 / 48 EI</math></p>	<p><b>01 M</b></p> <p><b>01 M</b></p>
d)	<b>State the values of maximum slope and maximum deflection for a cantilever beam of span ‘L’ carrying a point load ‘W’ at the free end . EI = constant</b>	
Ans.	 <p>Maximum slope = <math>\theta_B = dy/dx _B = WL^2/2EI</math></p> <p>Maximum deflection= <math>Y_B = - WL^3/ 3EI</math></p>	<p><b>01 M</b></p> <p><b>01 M</b></p>

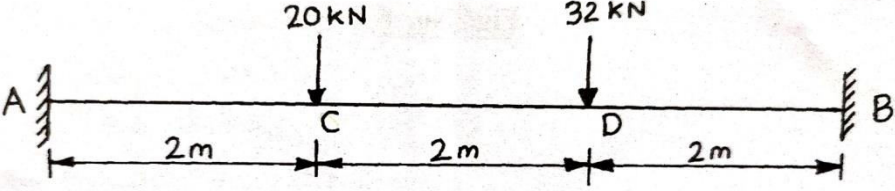

e)	<b>Compare a simply supported beam and a continuous beam w.r.t deflected shape of a beam.</b>	
Ans.	<p>The form of a curve to which the longitudinal axis of the beam bends after loading is called elastic curve or deflected shape of the beam. In the figure shows the deflected shape for various types of continuous beam. The deflected shape is shown by a dotted curve. Deflected shape simply supported beam and continuous beam</p>  <p>(i) Continuous beam with simply supported ends</p> <p>(ii) Continuous beam with one end fixed and other simply support</p> <p>(iii) Continuous beam with both ends fixed</p> <p>(iv) Continuous beam with end span overhanging</p>	<p>01 M</p>
f)	<p>Write the values of stiffness factor for beams.</p> <p>i) Simply supported at both ends</p> <p>ii) fixed at one end simply supported at other end</p>	<p>01 M</p> <p>01 M</p>
g)	<p>Make the following truss perfect by adding or removing the members, if required as shown in fig. No.1</p>  <p>(i)</p> <p>(ii)</p>	<p>01 M</p> <p>01 M</p>

<p><b>Ans.</b></p>	<p>For i) <math>n=5, j=4</math></p> <p><math>2j-3 = 2 \times 4 - 3 = 5</math>. since <math>n = 2j-3</math> hence the frame is Perfect frame</p> <p>iii) <math>n=5, j=4, 2j-3 = 2 \times 4 - 3 = 5</math> since <math>n = 2j-3</math> hence the frame is Perfect frame</p> 	<p><b>01 M</b></p> <p><b>01 M</b></p>
<p><b>Q. 2</b></p>	<p><b>Attempt any THREE of the following:</b></p>	<p><b>12 M</b></p>
<p>a)</p>	<p><b>Explain the effect of eccentric load with sketch w.r.t stresses developed</b></p>	
<p><b>Ans.</b></p>	<p>Effect of eccentric load: A load whose line of action does not coincide with the axis of a member is called an eccentric load. The distance between the eccentric axis of the body and the point of loading is called an eccentric limit 'e'. Due to effect of eccentricity axial load causes only direct stress whereas an eccentric load causes direct as well as bending stresses. Direct load is that force which acts at centroidal longitudinal axis of the member. Eccentric load is that force which act away from centroidal longitudinal axis of the member. Thus the resultant stresses due to direct as well as bending stresses in the member</p>  <p><b>Direct stress = <math>\sigma_0</math> , Bending stress = <math>\sigma_b</math></b></p> <p><math>\sigma_0 = P / A, \sigma_b = (M \times y) / I</math> therefor <math>\sigma_b = M/Z</math> But, Resultant stresses =</p> <p><math>\sigma_{\text{direct}} + \sigma_{\text{bending}} \sigma_{\text{max}} = \sigma_0 + \sigma_b,</math></p> <p><math>\sigma_{\text{min}} = \sigma_0 - \sigma_b</math></p>	<p><b>02 M</b></p> <p><b>01 M</b></p> <p><b>01 M</b></p>

<p>c)</p>	<p>Calculate fixed end moments and Draw BMD for a beam as shown in Fig. No. 5. Use first principle method.</p> 	
<p><b>Ans:</b></p>	<p>1. Assume beam is simply supported beam and calculate simply supported BM.</p> $M_{max} = M_{AB} = \frac{wL^2}{8} = \frac{9.6 \times 5^2}{8} = 30.0 \text{ kN.m}$ <p>2. Calculate Fixed end Moments</p> $M_A + M_B = \frac{-2a}{L}$ <p>a = Area of SS BM dia. = area of Parabola = <math>\frac{2}{3} bh</math></p> $a = \frac{2}{3} \times 5 \times 30 = 100 \text{ kN.m}$ $M_A + M_B = \frac{-2 \times 100}{5} = -40 \text{ ----- (I)}$	<p><b>01 M</b></p>

$$\text{and } M_A + 2M_B = \frac{-6ax}{L^2}$$

$x = \text{C.G. of SS BM} = 5/2 = 2.5\text{m}$

$$M_A + 2M_B = \frac{-6 \times 100 \times 2.5}{5^2} = -60 \text{ ----- (II)}$$

Solving Two Simultaneous Equations I and II

$$M_A = -20 \text{ kN.m} \quad M_B = -20 \text{ kN.m}$$

**OR**

*Note: Fixed end moments can be calculated by using standard formula as formula is Derived using First Principle, hence if students solve problem using formula appropriate Marks shall be given*

$$M_{AB} = -\frac{wL^2}{12} = -\frac{9.6 \times 5^2}{12} = -20.0 \text{ kN.m}$$

$$M_{BA} = \frac{wL^2}{12} = +\frac{9.6 \times 5^2}{12} = +20.0 \text{ kN.m}$$

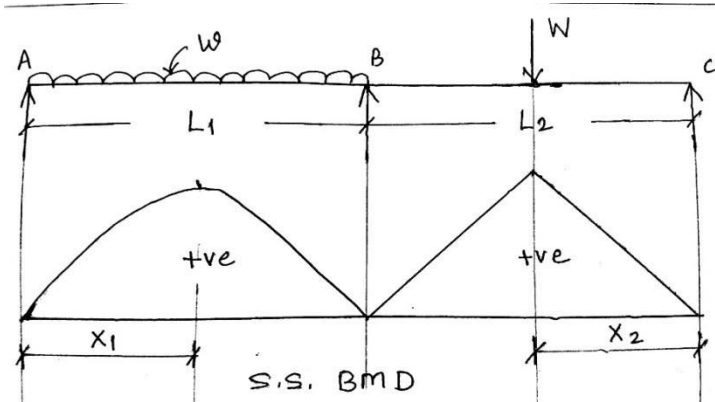

3. Draw Final BM diagram by overlapping simply supported BM and Fixed end BM.

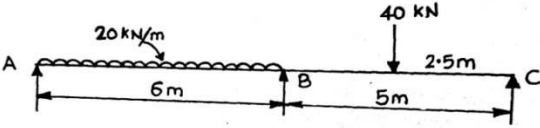

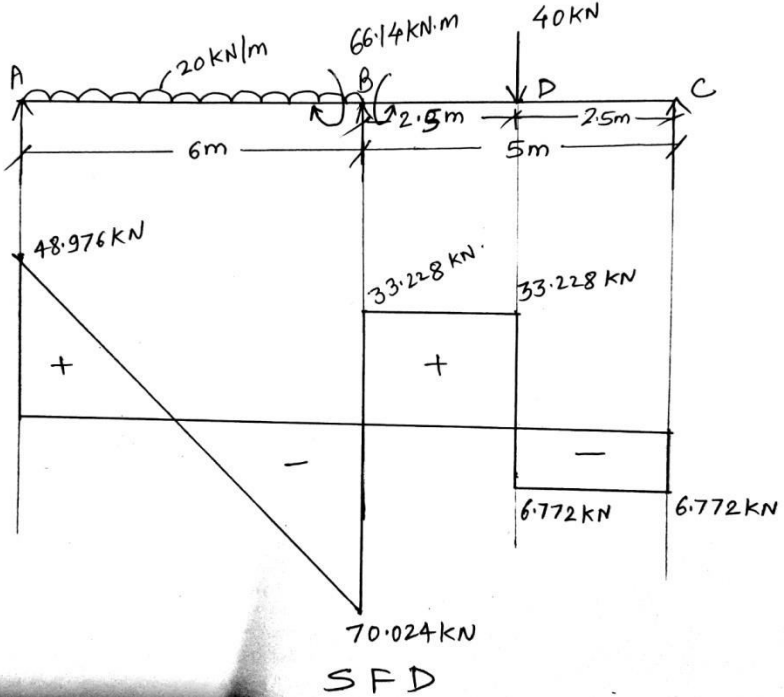

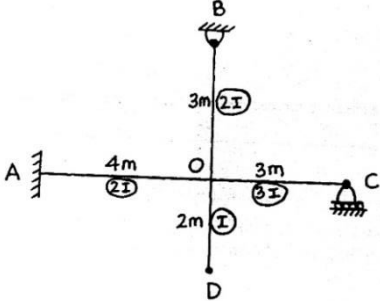

d) i) Explain with sketch the effect of fixity on bending moment of a beam.

**Ans:** If simply supported beam is considered subjected to any pattern of loading, beam bends and slopes will developed at the ends. If however, the ends of beam is firmly built in supports i.e. ends are fixed, slopes at the supports are zero. Fixity at ends induces end moments. Due to fixity, deflection of beam at center of beam is also reduced as compared to simply supported beam.

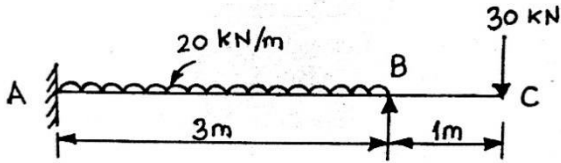

<b>(ii)</b>	<b>State two advantages of fixed beam over simply supported beam.</b>	
<b>Ans:</b>	<ol style="list-style-type: none"> <li>1. End slopes of fixed beam are zero</li> <li>2. A fixed beam is more stiff, strong and stable than a simply supported beam.</li> <li>3. For the same span and loading, a fixed beam has lesser values of bending moments as compared to a simply supported beam.</li> <li>4. For the same span and loading, a fixed beam has lesser values of deflections as compared to a simply supported beam.</li> </ol>	<b>02 M for any 2</b>
<b>Q.4.</b>	<b>Attempt any THREE of the following</b>	<b>12</b>
<b>a)</b>	<b>State Clapeyron's theorem of three moments for continuous beam with same and different EI</b>	
<b>Ans:</b>	<p>The clapeyron's theorem of three moment is applicable to two span continuous beams. It state that " For any two consecutive spans of continuous beam subjected to an external loading and having uniform moment of inertia, the support moments <math>M_A</math>, <math>M_B</math> and <math>M_C</math> at supports A,B and C respectively are given by following equation</p> $M_A + 2M_B(L_1 + L_2) + M_C L_2 = - \left[ \frac{6A_1 X_1}{L_1} \right] - \left[ \frac{6A_2 X_2}{L_2} \right]$  <p>If the moment of inertia is not constant then clapeyron's theorem can be stated in the form of following equation.</p> $M_A \frac{L_1}{I_1} + 2M_B \left( \frac{L_1}{I_1} + \frac{L_2}{I_2} \right) + M_C \frac{L_2}{I_2} = - \left[ \frac{6A_1 X_1}{L_1 I_1} + \frac{6A_2 X_2}{L_2 I_2} \right]$ <p>Where, <math>L_1</math> and <math>L_2</math> are length of span AB and BC respectively.  <math>I_1</math> and <math>I_2</math> are moment of inertia of span AB and BC respectively.  <math>A_1</math> and <math>A_2</math> are area of simply supported BMD of span AB and BC respectively.  <math>X_1</math> and <math>X_2</math> are distances of centroid of simply supported BMD from A and C respectively.</p>	<p><b>01 M</b></p> <p><b>01 M</b></p> <p><b>01 M</b></p> <p><b>01 M</b></p>

**Q.6. Attempt Any Two of the following** **12 M**

a) calculate support moment for a span as shown in fig no.11 Use moment distribution method

**Ans:** Solution :- Assume span AB & BC as a fixed beam and find fixed end moment

$$M_{AB} = -WL^2/12 = -10(5)^2/12 = -20.83 \text{ KN-m}$$

$$M_{BA} = WL^2/12 = 10(5)^2/12 = 20.83 \text{ KN-m}$$

$$M_{BC} = -Wab^2/L^2 = 50(2)(2)^2/4^2 = -25 \text{ KN-m}$$

$$M_{CB} = +Wab^2/L^2 = 5*2*2^2/4^2 = 25 \text{ KN-m}$$

To find the Stiffness factor at joint B

$$K_{BA} = 3EI/L_{AB} = 3E(2I)/5 = 6EI/5 = 1.2 EI$$

$$K_{BC} = 3EI/L_{BC} = 3EI/4 = 0.75 EI$$

$$\sum K = 1.2EI + 0.75EI = 1.95 EI$$

**Distribution Factor**

$$DF_{BA} = K_{BA}/\sum K = 1.2EI/1.95EI = 0.62$$

$$DF_{BC} = K_{BC}/\sum K = 0.75EI/1.95EI = 0.38$$

Point	A	B	C
Member	AB BA		BC CB
Distribution factor	0.62		0.38
Fixed end moment	-20.83 20.83		-25 25
Release support A & C and then carry over from A to B from C to B	+20.83 10.415		-25 -12.5
Initial moment	0 31.245		-37.5 0
Ist distribution C balance B		+3.87	+2.37
Final moment		+35.12	-35.12

Assume span AB and BC to be simply supported beam and find free BM.

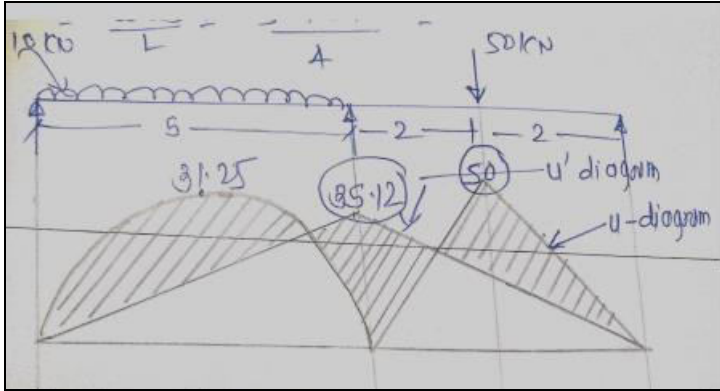

For span AB  $L=5m$   $W=10KN/m$

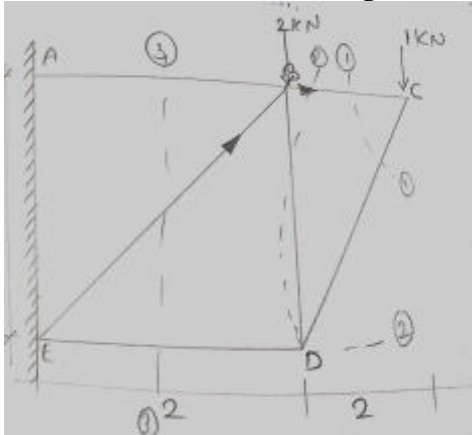

$$M_{max} = wl^2/8 = 10*(5)^2/8 = 31.25 \text{ KN.m}$$

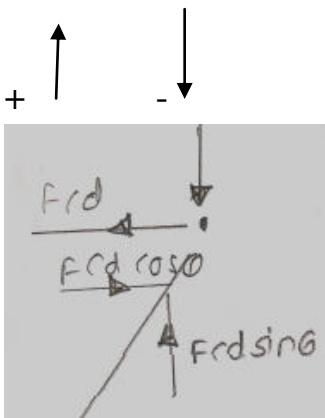

**01 M**

**01 M**

**02 M**

<p>For span BC  SPAN BC =4m ,a=2m b=2m w =50 kn  = wab/L =50*2*2 /4 =<b>50kn-m</b></p> 	<b>02 M</b>
--	-------------

<p>b) Calculate magnitude &amp; state the nature of forces in the member AB,BC,CD,DE,BD &amp; BE of truss as shown in fig (12) use method of section</p> 	
---	--

<p><b>Ans:</b> Consider <math>\triangle</math> CBD <math>\tan \theta = 2/2 = 45</math>  <math>\theta = 45</math>  Consider section (1)-(1) cut at BC &amp; CD (joint C )</p>  <p><math>\sum F_Y = 0</math>  <math>0 = -1 + F_{cd} \sin \theta</math>  <math>F_{cd} \sin \theta = 1</math></p>	
--	--

$$F_{cd}=1.41 \text{ KN (C)}$$

$$\sum F_x=0$$

$$0= F_{cd} \cos \theta - F_{cb}$$

$$F_{cb} = F_{cd} \cos \theta$$

$$= 1.41 \cos 45$$

$$= \mathbf{0.997}$$

$$= \mathbf{1 \text{ KN(T)}}$$

**02 M**

Consider section (2)-(2) cut at CD,BC,ED

Consider right hand side

$$\sum f_y=0$$

$$0=-1-F_{cd} \sin \theta +F_{bd}$$

$$F_{bd}=1+F_{cd} \sin 45$$

$$F_{bd}=2(\text{T})$$

**02 M**

$$\sum f_x=0$$

$$0= - F_{cd} \cos \theta +F_{ed}$$

$$1.41 \cos 45 =F_{ed}$$

$$F_{ed} =1.41 \cos 45$$

$$\mathbf{F_{ed}= 1 \text{ kN(c)}}$$

Consider section (3)-(3), take moment at @ A

$$0=F_{be} \cos 45 +F_{ed} *2 +2*2+1*4$$

$$10 = 1.41 F_{be}$$

$$F_{be} =7.092 \quad (-\text{ve indicate compressive})$$

$$\sum f_x=0$$

$$0= -f_{ab}+f_{be} \cos 45 +f_{ed}$$

$$F_{ab} =7.092 \times \cos 45 +1$$

$$F_{ab} =6.014 \text{ (T)}$$

**01 M**

**01 M**

MEMBER	FORCE (KN)	NATURE
AB	6.014	TENSION
BC	1	TENSION
CD	1.41	COMPRESSION
DE	1	COMPRESSION
BD	2	TENSION
BE	7.092	COMPRESSION

c) calculate magnitude &state the nature of forces in member AB,BC,CD,AD&BD Of a truss as shown in fig . use method of joints.

Ans:

$$\sum f_y = 0$$

$$R_A + R_C = 100, \text{ due to symmetry}$$

$$R_A = R_C = W/2 = 100/2 = 50 \text{ kN}$$

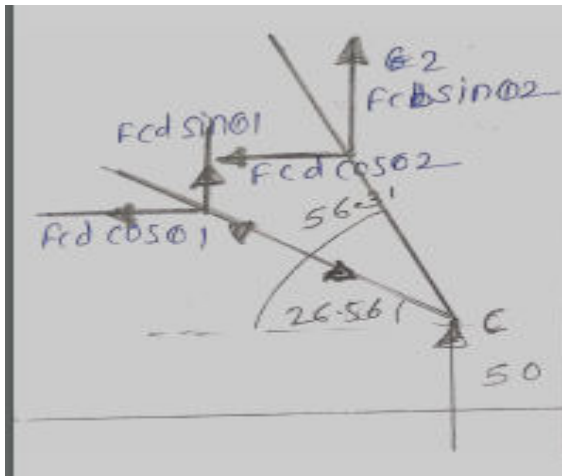

Consider joint C

$$\theta_1 = \tan^{-1} \theta_1 = 1/2 \quad \theta_2 = \tan^{-1} \theta_2 = 3/2$$

$$\theta_1 = 26.56^\circ \quad \theta_2 = 56.31^\circ$$

01 M

**Consider Joint C**

$$\sum F_x = 0 \quad f_{cd} \cos \theta_1 + f_{ce} \cos \theta_2 = 0$$

$$0.8944 f_{cd} + 0.55 f_{ce} = 0 \quad \text{_____} 1$$

$$\sum f_y = 0$$

$$0 = 50 + f_{cd} \sin \theta_1 + f_{ce} \sin \theta_2$$

$$-50 = f_{cd} \sin \theta_1 + f_{ce} \sin \theta_2$$

$$-50 = 0.4471 f_{cd} + 0.832 f_{ce} \quad \text{_____} 2$$

Solving both equation 1 & 2, We get

**Fcd= 55.91 KN (T)**

**Fcb = -90.143 KN (C)**

**02 M**

**Consider Joint B**

**02 M**

$\sum F_Y = 0$

$0 = F_{bd} - 100 + 90.143 \sin 56.31 + 90.143 \sin 56.31$

$F_{bd} = 50 \text{ KN}$
