	a)	<p><b>Describe the process of smelting of copper ore with labelled diagram</b></p> 	1	4

**Summer-2014 Examination**

**Subject Code: 17211**

**Page No: 6/12**

Que. No.	Sub. Que.	Model Answers	Marks	Total Marks
<b>2</b>		<p>Roasted copper ore is then mixed with coke &amp; sand particles &amp; then strongly heated at about 1350<sup>0</sup>C in a water jacketed blast furnace. At high temperature ferrous sulphide (FeS) is oxidised &amp; converted into ferrous oxide (FeO) which further reacts with sand particles to form a fusible slag (FeSiO<sub>3</sub>)</p> $2\text{FeS} + 3\text{O}_2 \longrightarrow 2\text{FeO} + 2\text{SO}_2 \uparrow$ $\text{FeO} + \text{SiO}_2 \longrightarrow \text{FeSiO}_3$ <p>Further cuprous oxide (Cu<sub>2</sub>O) formed during roasting combines with ferrous sulphide (FeS) to form ferrous oxide (FeO) &amp; cuprous sulphide (Cu<sub>2</sub>S). The ferrous oxide (FeO) formed further react with silica particles to form slag.</p> $\text{Cu}_2\text{O} + \text{FeS} \longrightarrow \text{FeO} + \text{Cu}_2\text{S}$ <p>Thus during smelting process most of the ferrous sulphide impurity is converted into the fusible slag (FeSiO<sub>3</sub>) which is then removed from the upper slag outlet. The molten mass containing mostly cuprous sulphide (Cu<sub>2</sub>S) &amp; little quantity of ferrous sulphide (FeS) is called as matte which is then removed from the lower outlet.</p>	<b>1</b>	
	<b>b)</b>	<p><b>What is the role of cryolite in electrolytic reduction of alumina. Explain the process.</b></p> <p><b>Role Of Cryolite:-</b></p> <p>The pure alumina is bad conductor of electricity &amp; its melting point is 2000<sup>0</sup>c. Hence electrolytic reduction of alumina is carried out in presence of cryolite because the presence of cryolite decreases the melting point of alumina &amp; also increases its electrical conductivity.</p>	<b>1</b>	<b>4</b>
		<div style="text-align: center;">  <p style="text-align: center;">Fig. Electrolysis of alumina</p> </div>	<b>1</b>	
		<p><b>Process:</b> Figure shows electrolytic reduction of alumina (Al<sub>2</sub>O<sub>3</sub>)</p> <ol style="list-style-type: none"> <li>i. Alumina is dissolved in fused cryolite and electrolyzed in an iron tank lined inside with carbon which acts as cathode</li> <li>ii. The anode consists of number of carbon rods, suspended vertically from the copper clamps.</li> <li>iii. The electrolyte is a mixture of alumina (20%), cryolite (60%) and calcium fluoride (20%).</li> <li>iv. The temp of both is kept at about 900-1000c</li> <li>v. On passing current, alumina decomposes to aluminium and oxygen.</li> </ol>	<b>2</b>

3	f)	<p><b>Explain construction and working of Daniel cell</b></p> <div style="text-align: center;">  </div> <p><b>Construction:-</b> It consists of zinc electrode dipped in ZnSO<sub>4</sub> Solution &amp; Copper electrode dipped in CuSO<sub>4</sub> solution. The two solutions are separated by a porous pot. The two solutions can seep through the pot &amp; so comes in contact with each other automatically. Thus, porous partition acts as a salt bridge.</p> <p><b>Working:-</b> The tendency of Zn to form Zn<sup>++</sup> is greater than the tendency of Zn<sup>++</sup> to get deposited as Zn on the electrode. Therefore Zn goes into the solution forming Zn<sup>++</sup>. On the other hand tendency of Copper to go into the solution is less than the tendency of Cu<sup>++</sup> to get deposited as Cu &amp; hence copper electrode becomes positively charged. The emf of cell is 1.1 volt.</p> <p><b>Cell reactions-</b></p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: left;">At Anode</td> <td style="text-align: center;"><math>Zn</math></td> <td style="text-align: center;"><math>\longrightarrow</math></td> <td style="text-align: center;"><math>Zn^{++} + 2e^{-}</math></td> </tr> <tr> <td style="text-align: left;">At Cathode</td> <td style="text-align: center;"><math>Cu^{++} + 2e^{-}</math></td> <td style="text-align: center;"><math>\longrightarrow</math></td> <td style="text-align: center;"><math>Cu</math></td> </tr> <tr> <td colspan="4" style="text-align: center;"><hr style="width: 50%; margin: 0 auto;"/></td> </tr> <tr> <td style="text-align: left;">Net Reaction</td> <td style="text-align: center;"><math>Zn + Cu^{++}</math></td> <td style="text-align: center;"><math>\longrightarrow</math></td> <td style="text-align: center;"><math>Zn^{++} + Cu</math></td> </tr> </table>	At Anode	$Zn$	$\longrightarrow$	$Zn^{++} + 2e^{-}$	At Cathode	$Cu^{++} + 2e^{-}$	$\longrightarrow$	$Cu$	<hr style="width: 50%; margin: 0 auto;"/>				Net Reaction	$Zn + Cu^{++}$	$\longrightarrow$	$Zn^{++} + Cu$	<p>1</p> <p>1</p> <p>1</p> <p>1</p>	<p>4</p>
