

**SUMMER-16 EXAMINATION**  
**Model Answer**

Subject code :(17562)

Page 1 of 24

**Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

2	<b>Attempt any TWO</b>						<b>16</b>
2-a	<p><b>Derivation for temperature dependency of rate constant from collision theory</b></p> <p>The collision rate of molecules in a gas is found from the kinetic theory of gases.</p> <p>For the bimolecular collision of like molecules A ,</p> $Z_{AA} = \sigma_A^2 n_A^2 \sqrt{\frac{4\pi kt}{M_A}}$ $= \sigma_A^2 \frac{N^2}{10^6} \sqrt{\frac{4\pi kt}{M_A}} C_A^2 \dots\dots(i)$ <p>= number of collisions of A with A / sec.cm<sup>3</sup></p> <p>Where <math>\sigma</math> = diameter of molecule, cm</p> <p>M = (molecular weight) / N, mass of a molecule, gm</p> <p>N = Avogadro's number</p> <p>C<sub>A</sub> = concentration of A, mol / liter</p> <p>n<sub>A</sub> = NC<sub>A</sub> / 10<sup>3</sup>, number of molecules of A / cm<sup>3</sup></p> <p>k = Boltzmann constant</p> <p>For the bimolecular collision of unlike molecules in a mixture of A and B, kinetic theory gives</p> $Z_{AB} = \{(\sigma_A + \sigma_B) / 2\}^2 n_A n_B \sqrt{8\pi kT \left(\frac{1}{M_A} + \frac{1}{M_B}\right)}$					2	8

SUMMER-16 EXAMINATION  
Model Answer

$$= \left\{ \left( \frac{1}{M_A} + \frac{1}{M_B} \right) / 2 \right\} \frac{2N^2}{10^6} \sqrt{8\pi kT \left( \frac{1}{M_A} + \frac{1}{M_B} \right)} C_A C_B \dots \dots \dots (ii)$$

If every collision between reactant molecules results in the transformation of reactants into product, these expressions give the rate of bimolecular reactions. The actual rate is much lower than that predicted and this indicates that only a small fraction of all collisions result in reaction. This suggests that only those collisions that involve energies in excess of a given minimum energy E lead to reaction. From the Maxwell distribution law of molecular energies the fraction of all bimolecular collisions that involves energies in excess of this minimum energy is given approximately by  $e^{-E/RT}$  where  $E \gg RT$ .

Thus the rate of reaction is given by

$$-r_A = -\frac{1}{V} \frac{dN_A}{dt} = k C_A C_B \dots \dots \dots (iii)$$

= ( collision rate, mole / liter.sec)\* (fraction of collision involving energies in excess of E )

$$= Z_{AB} \frac{10^3}{N} e^{-E/RT}$$

$$= \left\{ \left( \frac{1}{M_A} + \frac{1}{M_B} \right) / 2 \right\} \frac{2N}{10^3} \sqrt{8\pi kT \left( \frac{1}{M_A} + \frac{1}{M_B} \right)} e^{-E/RT} C_A C_B \dots \dots \dots (iv)$$

Comparing iii and iv,  $k \propto T^{1/2} e^{-E/RT}$

2

3

1

2-b

**Given:**

$$X_A = 0.70, t = 13 \text{ min}$$

For batch reactor, in which first order chemical reaction is taking place

$$-r_A = k.C_A$$

$$-\ln(1 - X_A) = kt$$

$$-\ln(1-0.70) = k * 13$$

$$k = 0.0926 \text{ min}^{-1}$$

**For Plug flow reactor** ( constant –density system):

$$\frac{V}{F_{A0}} = \int_0^{X_A} \frac{dX_A}{-r_A} = \frac{\tau}{C_{A0}}$$

2-c	<p><b>Packed bed(Fixed bed) reactor</b></p>  <p><b>Explanation:</b> Fixed bed reactors normally consist of one or more tubes packed with catalyst particles and are generally operated in vertical position. The catalyst particles may be of a variety of sizes and shapes – granular, pelleted, cylinder, spheres etc. Wires of metals are made into screens in the case of expensive catalysts.</p> <p>Chances of hot spot formation are there in fixed bed reactor. In order to prolong the time between regeneration and shut down, the reactor tube may be made longer than required. The</p>	<p>2</p> <p>2</p>	8

SUMMER-16 EXAMINATION  
Model Answer

problem of regeneration of catalyst is a serious issue in this type of reactor.

**Fluidized bed reactor with regenerator:**

**Explanation:**

Consider a bed of fine particles and gases passing upward through them. On increasing the flow rate, a point is reached when the solids become suspended in the gas stream. In this state the bed is said to be fluidized and the particular inlet gas velocity is called minimum fluidizing velocity. If the gas velocity is much larger than this minimum, the bed takes the appearance of a violently boiling liquid with solids in vigorous motion and large bubbles rising rapidly through the bed. In this case we have the bubbling fluidized bed. Industrial reactors particularly for solid catalyzed gas phase reactions often operate as bubbling beds with gas velocities equal to 9 to 30 times minimum fluidizing velocity.

b	<p>1. Deactivation by Fouling</p> <p>2. Chemical Deactivation - Poisoning</p> <p>3. Deactivation by Thermal Degradation and Sintering</p> <p><b>Description:</b></p> <p><b>Deactivation by Fouling</b></p> <p>Generally fouling covers all phenomena where the surface is covered with a deposit. The most widely known form of fouling of catalysts is coke formation. Most of coke formation arises as a result of carbonaceous residues covering the active sites of a heterogeneous catalyst surface, subsequently decreasing the active surface area of the catalyst. In addition the deposition of rust and scale from elsewhere in the catalytic system is not uncommon. Coke-forming processes also involve chemisorption of different kinds of carbons or condensed hydrocarbons that may act as catalyst poisons causing the chemical deactivation of the catalyst.</p> <p>Eg. The fouling of zeolite catalysts occurs in the form of coke molecules limiting the access of the reactant hexane to the active sites of catalyst.</p>	2 2

Model Answer

Subject code :(17562)

Page 17 of 24

Substituting the value of  $k_2$  from eq.III in above equation

$$\frac{dX_A}{dt} = k_1(1 - X_A) - \frac{k_1(1 - X_{Ae})}{(M + X_{Ae})}(M + X_A)$$

$$\frac{dX_A}{dt} = k_1 \left[ \frac{(1 - X_A)(M + X_{Ae}) - (1 - X_{Ae})(M + X_A)}{(M + X_{Ae})} \right]$$

$$\frac{dX_A}{dt} = k_1 \left[ \frac{M + X_{Ae} - MX_A - X_A X_{Ae} - M - X_A + MX_{Ae} + X_A X_{Ae}}{(M + X_{Ae})} \right]$$

Collecting the terms, we get

$$\frac{dX_A}{dt} = \frac{k_1[X_{Ae}(M + 1) - X_A(M + 1)]}{(M + X_{Ae})}$$

$$\frac{dX_A}{dt} = \frac{k_1(M + 1)}{(M + X_{Ae})}(X_{Ae} - X_A)$$

$$\int_0^{X_A} \frac{dX_A}{X_{Ae} - X_A} = \frac{k_1(M + 1)}{(M + X_{Ae})} \int_0^t dt$$

$$-\ln \left( \frac{X_{Ae} - X_A}{X_{Ae}} \right) = \frac{(M+1)}{(M+X_{Ae})} k_1 \cdot t \quad \text{eq. IV}$$

$$-\ln \left( \frac{X_{Ae} - X_A}{X_{Ae}} \right) = -\ln \left( \frac{C_A - C_{Ae}}{C_{A0} - C_{Ae}} \right) = \frac{(M+1)}{(M+X_{Ae})} k_1 \cdot t \quad \text{eq.V}$$

Eq.V is the desired integrated rate equation for reversible first order reaction.

**Graphical representation**

A plot of

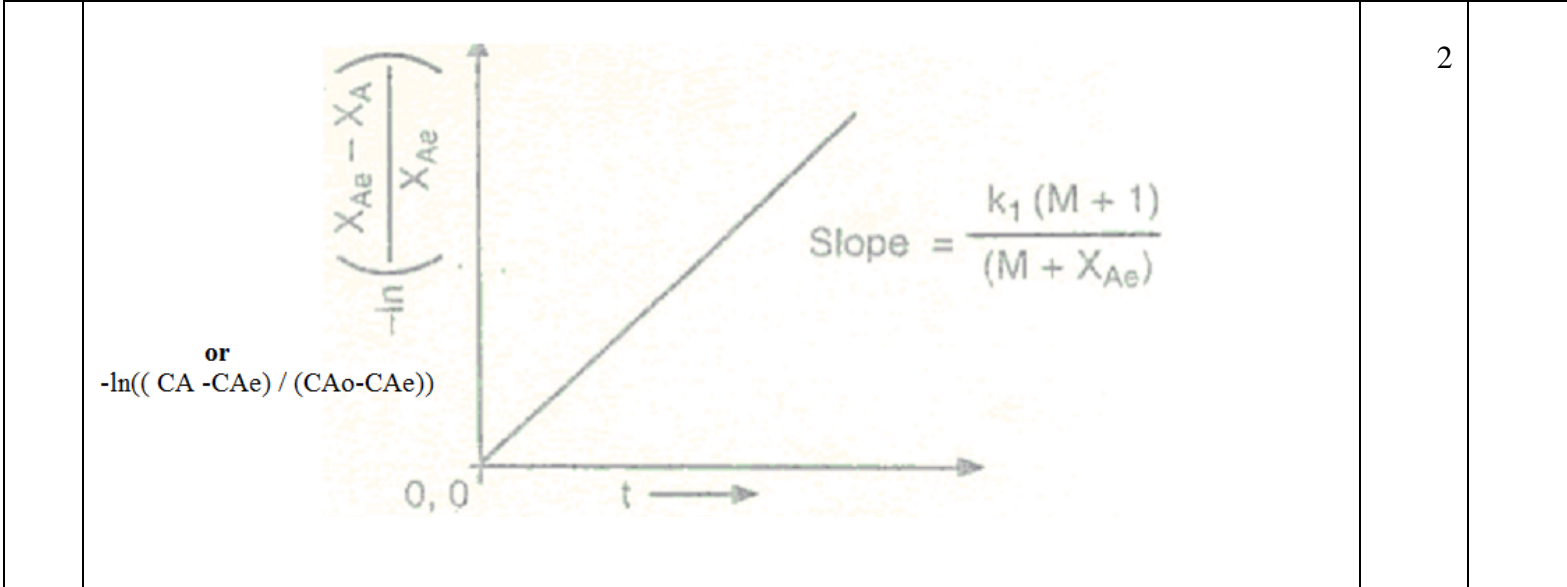

$$-\ln \left( \frac{X_{Ae} - X_A}{X_{Ae}} \right) \text{ vs time gives a straight line with slope equal to } \frac{(M + 1)}{(M + X_{Ae})} k_1.$$

5-b **Derivation of performance equation for PFR**

In PFR, the composition of the fluid varies from point to point along the flow path. So the material balance for a reaction component must be made for a differential element of volume  $dV$ .

Taking material balance of reactant A over the reactor,

Input of A to reactor = Output of A from reactor + Disappearance of A due to chemical reaction + Accumulation of A within the reactor.

For plug flow reactor, the last term is zero.

Input of A to reactor = Output of A from reactor + Disappearance of A due to chemical reaction .....(1)

**SUMMER-16 EXAMINATION**  
**Model Answer**

Subject code :(17562)

Page 19 of 24

Let,  $F_{A0}$  = Molar feed rate to the reactor.

$C_{A0}$  = Molar concentration of A in stream entering the reactor  
( moles/volume)

$X_A$  = Fractional conversion of A

$$F_A = F_{A0}(1 - X_A) = F_{A0} - F_{A0} \cdot X_A$$

$$dF_A = - F_{A0} \cdot dX_A$$

For the differential volume  $dV$

Input of A in moles/time =  $F_A$

Output of A from reactor in moles/time =  $F_A + dF_A$

Disappearance of A due to chemical reaction in moles/ time =  $(-r_A) dV$

Substituting all the terms in the material balance equation (1)

$$F_A = F_A + dF_A + (-r_A) \cdot dV$$

$$- dF_A = (-r_A) dV$$

$$F_{A0} \cdot dX_A = (-r_A) dV$$

$$\frac{dV}{F_{A0}} = \frac{dX_A}{-r_A}$$

This is the equation accounting for A in the differential section of the reactor of volume  $dV$ . For the whole reactor, the equation must be integrated.

$$\int_0^V \frac{dV}{F_{A0}} = \int_0^{x_A} \frac{dX_A}{-r_A}$$

$$\frac{V}{F_{A0}} = \int_0^{x_A} \frac{dX_A}{-r_A} = \frac{\tau}{C_{A0}}$$

Where  $X_A$  and  $(-r_A)$  are evaluated at the exit conditions

**For constant volume system :**

$$\frac{V}{F_{A0}} = \int_0^{x_A} \frac{dX_A}{-r_A} = \frac{\tau}{C_{A0}} = \frac{-1}{C_{A0}} \int_{C_{A0}}^{C_A} \frac{dC_A}{-r_A}$$

	7) MFR have long residence time compared to PFR. 8) MFR is not suitable for high pressure reactions whereas PFR is suitable.		
<b>6</b>	<b>Attempt any FOUR</b>		<b>16</b>
6-a	<b>Space time:</b> It is the time necessary to process one reactor volume of feed at specified conditions. <b>Unit:</b> (units of time) second, minute, hour <b>Space velocity:</b> It is the number of reactor volumes of feed at specified conditions which can be treated in unit time <b>Unit:</b> (reciprocal of time) second <sup>-1</sup> , minute <sup>-1</sup> , hour <sup>-1</sup>	1  1  1	4
6-b	<b>Temperature increase is not desirable for exothermic reaction.</b> Van't Hoff equation is $\frac{d \ln K}{dT} = \frac{\Delta H}{RT^2}$ For exothermic reaction, $\Delta H$ is negative. When temperature is increased, $dT$ is positive; the overall equation is negative, which means $\ln K$ is negative. When $\ln K$ is negative, the value of $K$ is low which denotes lower concentration of products. Therefore temperature increase is not desirable for exothermic reaction.	1   3	4
6-c	<b>Significance of activation energy.</b> Activation energy is the minimum energy that the reactants must acquire before reaction takes place to give the product. Activation energy can be considered as a potential energy barrier. Only those molecules that have sufficient energy to reach the top of the barrier and form activated complex react. Smaller the activation energy (low barrier), greater will be the number of activated molecules and faster will be the rate of reaction. It will help to find out the nature of the reaction (endothermic or exothermic) It will give the difference between activated complex and energy of reactant.	4	4

Page 22 of 24

6-d **Differential method of analysis of data**

1) Assume a mechanism and from it obtain a rate equation of the form

$$-r_A = \frac{-dC_A}{dt} = kf(c)$$

2) From experiment obtain concentration-time data and plot them.

3) Draw a smooth curve through this data.

4) Determine the slope of this curve at suitably selected concentration values. These slopes ( $\frac{-dC_A}{dt}$ ) are the rates of reaction at these composition.

5) Evaluate  $f(c)$  for each composition.

6) Plot  $\frac{-dC_A}{dt}$  vs  $f(c)$  for each composition. If we get a straight line through origin, the rate equation is consistent with the data. If not, the another rate equation should be tested.

Page 23 of 24

6-e **Method of feeding when PFR's are connected in parallel**

Consider PFRs are connected as follows

For the PFRs connected in parallel, the whole system can be treated as a single plug flow reactor of volume equal to total volume of the individual units if the feed is distributed in such a manner that fluid stream which meet have the same composition. Thus for reactors in parallel,  $V/F$  must be the same for each parallel line.

Let us consider from above figure that volume of reactor 1 in branch A is  $V_1$  & of reactor 2 in branch B is  $V_2$ .

For branch A 
$$\frac{V_1}{F_{01}} = \int_0^{x_1} \frac{dX}{(-r)}$$

For branch B 
$$\frac{V_2}{F_{02}} = \int_0^{x_2} \frac{dX}{(-r)}$$

For the PFRs in parallel, the ratio  $V/F$  must be identical if the conversion is to be the same in each branch.

$x_1 = x_2 = x$

$$\frac{V_1}{F_{01}} = \frac{V_2}{F_{02}}$$

$$F_0 = F_{01} + F_{02}$$

Therefore Feed flow to first branch should be multiple of  $\frac{V_2}{F_{01}} \cdot V_1$

4

**SUMMER-16 EXAMINATION**  
**Model Answer**

Subject code :(17562)

Page **24** of **24**

For example:

If  $V_1 = 80$  lit &  $V_2 = 40$  lit

$$\frac{F_A}{F_B} = \frac{V_A}{V_B} = \frac{80}{40} = 2$$

Therefore  $2/3$ <sup>rd</sup> of feed must be fed to branch A.
