## MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION

(Autonomous) (ISO/IEC -270001 – 2005 certified)

Page No: 1/15

# WINTER -2016 EXAMINATION Model Answer

## **Important Instructions to examiners:**

- 1) The answer should be examined by keywords and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language error such as grammatical, spelling errors should not be given more importance. (Not applicable for subject English and communication skill).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figure drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In the some cases, the assumed constants values may vary and there may be some difference in the candidates answer and model answer.
- 6) In case of some questions credit may be given by judgment on part of examiner of relevant answer based on candidates understanding

Question and Model Answers	Marks
Q.1 Attempt any FIVE of the following:	20 M
a) Define Solid waste and list any four sources of solid waste.	04
Defn Solid waste means discarded material including solid, liquid and semi	02M
solid resulting from domestic, Industrial, commercial, Agriculture and Mining operation.	
Sources	
Residential:	
Commercial:	½ M
➤ Institutional:	Each
Municipal:	(Write
➤ Industrial:	any
> Agricultural:	Four)
Open areas:	
b) Enlist any four transport vehicles with their capacities for transporting	04
municipal waste.	
➤ Handcart- Consist of 6 or 8 bins of 25 lit capacity.	1M (1/2
Animal cart - 1.5 M <sup>3</sup>	for name
Auto vehicle - 2 M <sup>3</sup>	and ½
Dumper $-12 \text{ M}^3$	for
Compactor - 5 - 10 M <sup>3</sup>	capacity)
Tractor and Trailer- 6 M <sup>3</sup>	Each
$ ightharpoonup$ Truck - $10 \mathrm{M}^3$	(Write
	any
	Four)

c) State various factors affecting composting process.	04
> Temperature	-
Microorganisms require a certain temperature range known as Mesophiles (20-45°C or 68-113°F) and thermophiles (45°C or 113°F) for optimal activity. Certain temperatures promote rapid composting and destroy pathogens and weed seeds.  Thermopiles bacteria can turn waste to compost almost 6 months faster than the lower temperature bacteria.  Moisture Level	1mark for any Four
Microorganisms living in a compost pile need an adequate amount of moisture to survive. Moisture is very important for a composting toilet. Without moisture, no bacteria can perform the processes necessary for composting.  > Air Circulation or Oxygen Level	
Aerobic conditions are important for proper composting and odor control. If anaerobic (no air present) conditions are allowed to exist, then foul and offensive odors. Providing proper ventilation by designing the composting toilet with a vent pipe.  Particle size: Smaller particle size increases conversion rate during composting.	
<ul> <li>pH: During the composting process, the pH level will fluctuate according to the different reactions produced by the micro-organisms.</li> <li>Carbon/Nitrogen Nutrient Ratio</li> </ul>	
The proper balance of nutrients is vital to the composting process. A good carbon/nitrogen (C/N) ratio for a compost toilet is 20/1 to 35/1. This means far more carbon must be present in the vault to the nitrogen for good composting to proceed. Because of the composition of feces and urine, a lot of carbon in the form of hay, straw, wood chips, and sawdust have to be added to the compost toilet.	
d) Define Biomedical Waste and enlist any four sources of generation of biomedical waste.	04
<b>Defn</b> Bio-medical waste means any solid and or liquid waste including its container and any intermediate product, which is generated during the diagnosis, treatment of human beings or animals or in research and testing.	02 M
Sources	½ M

2. Alley Service		For
3. Set out Set Back S	Service	Classifi
4. Backyard Service		cations
Duckjula bol vice		Cations
B) Collection Method Base	ed on mode of operation:	
1. Hauled Container	<del>-</del>	
2. Stationary Contai	•	

# A) Classification of collection system Based on the availability of service

## 1. Curb (Kerb-side)

- Kerb side collection, or curbside collection, is a service provided to households, typically in urban and suburban areas, of removing household waste.
- House owner is responsible for placing solid waste containers at the curb on scheduled day.
- The work man come, collect and empty the container and put back at the curb.
- House owner is required to take back the empty containers from the curb to his house.
- Ouickest/ economical
- Crew: 1 driver + 1 or 2 collectors
- No need to enter property

## 2. Alley Service -

The containers are placed at the alley line from where they are picked up by workmen from refuse vehicle who deposit back the empty container.

#### 3. Set out Set Back Service -

Set out man go to the house collect containers and empty them in the refuse vehicle. Another group of persons return them to the house owner's yard.

## 4. Backvard Service -

The workers with the vehicles carry a bin, wheel-barrow or sack or cloth to the yard and empty the solid waste container in it. The wheel barrow or bin is then taken to solid waste vehicle where it is emptied.

#### B) Collection Method Based on mode of operation:

## 1. Hauled Container System

An empty storage container (Known as a drop- off box) is hauled to the storage site to replace the container that is full of waste, which is then hauled to the processing point, transfer station or disposal site.

#### 2. Stationary Container System

In this system, containers used for the storage of waste remain at the point of collection. The collection vehicles generally stop alongside the storage containers, and collection crews load the waste from the storage containers into the collection vehicles and then transport the waste to the processing, transfer or disposal site.

b) Enlist Various Methods of land filling and explain any one of them. Give the	ı
advantages and disadvantages of land filling.	ı
<b>❖</b> Land filling methods	
1) Area method	l

- 2) Trench method
- 3) Slope method
- 4) Valley method

04 M For Any One Method Explain

08 M

1/2 M

each

#### 1) Area method

The Area Method is used when the terrain is unsuitable for the excavation of trenches in which to place the solid wastes. The filling operation usually is started by building an earthen bund against which wastes are placed in thin layers and compacted as the fill progresses until the thickness of the compacted wastes reaches a height of 2 to 3 m at the end of day's operation a 150 mm to 300 mm layer of cover material is placed over the compacted fill. The cover material must be hauled in by truck or earth-moving equipment from adjacent land or from borrow-pit areas. A final layer of cover material is used when the fill reaches the final design height.

2M FOR ANY ONE METHOD

#### 2) Trench method

- The trench method is suited to areas where an adequate depth of cover material is available at the site.
- Where the water table is well below the surface.
- To start the process, a portion of the trench is dug with a bulldozer and the dirt is stockpiled to form an embankment behind the first trench.
- Wastes are then placed in the trench, spread into thin layers and compacted.
- The operation continues until the desired height is reached.
- Cover material is obtained by excavating an adjacent trench or continuing the trench that is being filled.
- 3) **Slope Method-** In hilly regions it is not possible to find flat ground for landfilling, in such situation waste is placed along the sides of existing hill slope. The wastes are spread on existing slope, compacted & covered. The cover materials usually come from just ahead of the working face.

## 4) Valley Method-

- At locations where natural or artificial depression exists, it is often possible to use them effectively for land filling operations.
- Canyons, ravines, fry borrow pits and quarries have all used for this purpose.
- The technique to place and compact solid waste in depression landfills vary with the geometry of the site, the characteristics of the cover material, the hydrology and geology of the site, and the access to the site.

## **Advantages of Landfilling:**

- Volume can increase with little addition of equipment.
- Filled land can be reused for other community purposes.
- Low cost and ease of application, no high-tech.
- Absorb massive amounts of solid wastes.
- Replanting the area with trees is possible.
- Access to methane.

## **Disadvantages of Landfilling:**

- Leakage of air pollutant gases: methane, carbon dioxide.
- Possibility of contamination of water sources by waste water resulting from landfill.
- Requires proper planning, design, and operation

2M

c)	Enlist types of incinerators. Explain any one of them. Give the advantages	08 M
	and disadvantages of incineration process.	
*	Types of Incinerators -	½M for
	1) Mass burner Incinerator	Four
	2) RDF (Refuse-Derived fuel) based incinerator	Types
	3) Modular Incinerators	
	4) Fluidized bed incineration	
Mas	ss burner Incinerator:	
•	This incinerator consists of two or three incineration unit ranging from 50 to 1000	
	tons per day. These are design to incinerate the municipal solid waste as collected	
	without prior processing. It is flexible and convenient.	02 M
•	It is continuously fed to a grate system the waste intake are usually includes	For
	tipping floor a pit, a crane and sometimes a conveyors. Truck dumps solid waste	Any
	on floor or directly into a pit.	One
•	When waste is dumped on floor bulldozer is used to push them into a pit or	Explan
	conveyor and then it is fed to grate system which moves waste through	tion
	combustion chamber	
RD	F based incinerator:	
•	RDF is homogeneous system and better control on combustion and can recover more energy.	
•	Various components like metal, glass and non-combustible material can be removed to produce RDF.	
•	The combustible waste is shredded into uniform particle size, then pelletisation is	
	done to get RDF pellets.	
•	In this system process solid waste refuse derived fuel is burnt.	
	odular Incinerators:	
i) <b>M</b>		
i) M •	These are prefabricated units with relatively small capacities.	
i) M • •		
i) M • •	The capacity range is in between 5 to 120 tones solid day.	
i) M • •		

# iv) Fluidized bed incineration:

- This type of combustion system includes steel vertical cylinder lined from inside with bricks and sand is placed as bed.
- Air nozzles are provided to inject air at high pressure.
- Solid fuel is injected into chamber along with natural gas or oil initially to increase temperature of incinerator.
- This system is suitable for burning sewage sludge and other chemical waste.

	<u></u>
<ul> <li>Advantages of Incineration:</li> <li>i) This is most hygienic method, since it ensures the complete destructions of</li> </ul>	02 M For Any
pathogens.	Two
ii) There is no odour trouble or dust nuisance.	Points
iii) The heat generated can be used for raising the steam power.	
iv) Clinkers produce can be used for the road purpose.	
<b>❖</b> Disadvantages of Incineration:	02 M
i) Large initial expenditure.	For Any
ii) Improper operation results air pollution problems and incomplete reduction of waste materials.	Two Points
iii) Disposal of remaining residue is required,	
iv) High stacks are needed for the natural draft chimneys present safety problems.	
Q. 4 Attempt any FOUR of the following:	16 M
a) Explain the term waste prevention and waste reduction.	04
<b>❖</b> Waste prevention-:	02 M
• Waste prevention is often called source reduction which means reducing	
waste by not producing it.	
• Waste prevention actually avoids waste generation, it is the preferred waste	
management activity	
• Overall, waste prevention conserves resources, protects the environment, and prevents the formation of greenhouse gases.	
<ul> <li>Waste Reduction:</li> <li>Waste reduction can be achieved in three ways: <ol> <li>Reducing the amount of material used per product without sacrificing the utility of that product.</li> <li>Increase lifetime of a product.</li> <li>Eliminating the need of the product.</li> </ol> </li> <li>To reduce waste we usually have to make significant lifestyle changes. Reduce</li> </ul>	02 M
office paper waste by implementing a formal policy to duplex all draft reports and by making training manuals and personnel information available electronically.  Improve product design to use less material.  Switch to reusable transport containers	

d)	State the methods of storage of solid municipal waste.	04 M
1)	Large numbers of open communal storage sites and unofficial dumps.	
2)	Plastic buckets (with lids), with capacities between 7 and 10 L,	
3)	Plastic bins (with lids), with capacities between 30 and 60 L and equipped with	
	handles	½ M
4)	Galvanized steel or plastic bins (with lids), with a capacity between 50 and 70 L,	Each
5)	Disposable plastic bags have a number of advantages.	(Write
6)	Other items commonly used for the storage of wastes include cardboard boxes,	any
	kerosene cans, and containers made out of truck tires.	Eight)
7)	DEPOTS a depot typically consists of a single-story building about the size of a	
	large garage.	
8)	ENCLOSURES an enclosure is probably the most common communal storage	
	method in Asia. Enclosures can have capacities from 1 to 10 m3	
9)	FIXED storage bins this type of container usually is built from concrete blocks.	
<b>e</b> )	What do you understand by Vermi-composting?	04 M
*	Vermicompost is the product or process of composting using various worms,	
	usually red wigglers, white worms, and other earthworms to create a	02 M
	heterogeneous mixture of decomposing vegetable or food waste, bedding	
	materials, and vermicast.	
*	Vermicomposting- Concept	
•	Take a small wooden box or dig a small pit.	<b>02M</b>
•	Spread a net on box.	
•	Also spread 1 or 2 cm thick layer of sand.	
•	Put some cow dung and kitchen wastes such as peels of fruits etc., to cover the	
	sand.	
•	Use green leaves to cover over the sand.	
•	Sprinkle some water to make this layer wet.	
•	Get some red worms and put them on the upper layer of bed.	
•	Feed vegetable and fruit wastes as food.	
•	After 3 to 4 weeks we get loose, soil like material in the pit.	
•	Remove the material from the box, dry it in the sun.	
	Use this as manure.	
f)	Explain pyrolysis of waste.	04 M
	Pyrolysis can be defined as the thermal decomposition of organic material	
throug	h the application of heat without the addition of extra air or oxygen.	
	process thermal decomposition of organic matter at high temperature take place.	02 M
	Pyrolysis is an endothermic process which requires heat for an external source.	
	In this method solid waste material is heated in specially designed chamber	
which	is called as pyrolysis reactor.	
	In pyrolysis reactor, heating is carried out in closed environment which is almost	
OXVGE	n free at an average temperature above $650^{\circ}$ C which may rise to $1000^{\circ}$ C. The end	
	ts are Hydrogen, methane, carbon mono-oxide, tar or oil, char, inert material.	
produc	are rryurogen, memane, carbon mono-oxide, tar or on, char, men material.	

1. <b>Dry py</b>	of Pyrolysis:	
	rolysis	
• Pr	ocess of thermal decomposition without access of oxygen (O <sub>2</sub> )	
	oducts of dry pyrolysis are gas with high heat of combustion, liquid and solid bon residue.	
Te	pe of dry pyrolysis depend on the temperature of the process i.e. Low mperature Analysis, Medium Temperature Analysis, High Temperature allysis.	
2. Oxidizi	ng pyrolysis	
• It'	s impossible to achieve a completely oxygen-free atmosphere.	
	us, a small amount of oxidation occurs. If volatile or semi-volatile materials present in the waste, thermal desorption will also occur.	02M For Methods.
	ermal decomposition of industrial waste by its partial burning or direct contact th end product of fuel combustion	
• Th	is method is used for neutralization of most wastes including "inconvenient"	
	es for burning are present in the waste, thermal desorption will also occur.	
	ermal decomposition of industrial waste by its partial burning or direct contact	
	th end product of fuel combustion	
	is method is used for neutralization of most wastes including "inconvenient"	
on	es for burning	
O 5 Att	empt any TWO of the following:	16M
of E-v	E-Waste. State various types of E-Wastes. Explain the methods of disposal vaste.	8M
	f <sup>n</sup> E-waste is any refuse created by discarded electronic devices and	
	mponents as well as substances involved in their manufacture or use.	2M
• Tx		2M

1. 2. 3. 4. 5. 6.	rpes of E-Wastes are Computers, Office electronic equipment, Entertainment device electronics, Mobile phones, Television sets,	

- 2) Incineration: It is controlled and complete combustion process, in which the waste material is burned in specially designed incinerators at a high temperature. Advantage of incineration of e-waste is the reduction of waste volume and utilization of the energy content of combustible materials. Disadvantages of incineration are the emission to air of substances escaping flue gas cleaning and the large amount of residue from gas cleaning and combustion.
   3) Recycling of e-waste: Monitors and CRT, keyboards, laptops, modems, telephone
- 3) Recycling of e-waste: Monitors and CRT, keyboards, laptops, modems, telephone bards, hard drives, floppy drives, compact disk, mobiles, fax machines, printers, CPUs, memory chips, connecting wires and cables can be recycled. Recycling involves dismantling and recovery of valuable materials. Recycling is the best possible option for the management of e- waste because the existing dumping grounds in India are full and overflowing beyond capacity and it is difficult to get new dumping sites due to Scarcity of land.
- **4) Re-use:** It is commonly used for electronic equipments like computers, cell phones etc. It constitutes direct second hand use or use after slight modification to the original functioning equipment. This method also reduces the volume of e-waste generation.

## b) Describe method of collection and disposal of industrial waste.

8M

**1M** 

each

For the effective BMW management the state government shall establish prescribed authority for granting authorization to concern occupier/operator; who are required to maintain the annual & accident records of the facility.  Q.6. Atempt any FOUR of the following:  a) Write short note on health aspect during handling and processing of solid waste.  Health aspects involved in handling and processing of solid waste:  There is potential risk to environment and health from improper handling of solid wastes. Direct health risks concern mainly the workers in this field, who need to be protected, as far as possible, from contact with waste.  Traffic accidents can result from toxic spilled wastes.  Air pollution can be caused from the inefficient burning of wastes, either in open air, or in plants that lack effective treatment facilities from the gaseous effluents.  Uncontrolled hazardous wastes from industries mixing up with municipal wastes

□□Municipal Solid Wastes Management Systems involves various activities like storage, collection, transportation, disposal etc. These activities even if properly controlled and with proper precautionary measures adopted, may have adverse impact on land, water and air environment, human and environmental health aesthetics and quality of life.  □□The main risk to health is indirect and arises from the breeding of disease vectors,	
primarily files and rats.	
b) Describe health problems during time of segregation of solid waste.	4M
Health problem during the time of segregation  1. Workers and rag pickers can be infected during picking of biodegradable and Non biodegradable waste.  2. If biodegradable and non biodegradables or wet and dry wastes are not put separately, it can creates bad odour.  3. Possible health hazard include raised level of infant mortality, non communicable disease such as hand/leg injury by sharp edge material, respirational infections, eye infection,.  4. Comunicable diseases such as Diarrhoea & dysentery(due to flies), skin disease	1M each
c) State any four benefits of recycling of solid waste.	4M
□ Reduces the amount of waste sent to landfills and incinerators. □ Conserves natural resources such as timber, water and minerals. □ Saves energy. □ Prevents pollution by reducing the need to collect new raw materials. □ Reduces the environmental degradation. □ Reduce greenhouse gas emissions that contribute to global climate change.	1M each any four
d) Describe the process of recycling.	4M
<ul> <li>Recycling is the process of recovering and reusing waste product from household use, manufacturing, agriculture and business and thereby reducing their burden on the environment.</li> <li>Recycling is the process of collecting used materials, commonly known as waste and creating new products to prevent the waste of potentially useful materials.</li> <li>Recycling is the process of collecting and processing materials that would otherwise be thrown away as trash and turning them into new products. Recycling can benefit your community and the environment.</li> </ul>	4M
$\textbf{Collection} \Longrightarrow \textbf{Sorting} \Longrightarrow \textbf{Processing} \Longrightarrow \textbf{New Product}$	
(Note: Student may write any appropriate explanation so credit may be given accordingly)	

e) State the purpose of recycling of solid waste.	4M
<ul> <li>To Make Environment Clean</li> <li>Conservation of Materials</li> <li>To Save Energy</li> <li>Reduce Garbage in Landfills</li> <li>Reduce the pollution.</li> </ul>	1M each any four
f) State the importance of mass education in solid waste management.	4M
The mass education in SWM is very important because of following points:  1. To increase the awareness of solid waste management among the people.  2. To increase the efficiency and effectiveness of planning process and implementation of solid waste management.  3. To understand the planning, importance and significance.  4. To play an important role in the permitting process in case of hazardous waste as well as municipal waste facilities.  5. To improve the waste management strategies, negotiations with municipal authorities for better involvement in decision making.  6. To achieve the 3R principles.  7. To reduce littering of waste on streets and into drains, open spaces, etc.  8. To encourage and assists the local composting and recycling initiatives.	1M each any four
