

WINTER- 18 EXAMINATION

Subject Name: Public Health Engg.

Model Answer

Subject Code:

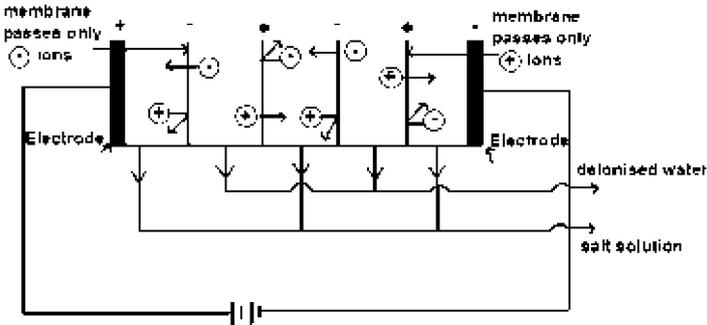

17503

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No.	Sub Q.N.	Answer	Marking Scheme
1. A)		Attempt any THREE of the following	12Marks
1. A)	(a) Ans.	<p>Draw a flow diagram of water supply scheme</p> <pre> graph TD A[Sources of water] --> B[Surface sources] A --> C[Underground sources] B --> D[Rivers] B --> E[Lakes] B --> F[Reservoirs] C --> G[Springs] C --> H[Wells] C --> I[Infiltration galleries] D --> J[Intake works] E --> J F --> J G --> J H --> J I --> J J --> K[Treatment works] K --> L[Sedimentation] K --> M[Filtration] K --> N[Disinfection] K --> O[Misc. treatment] L --> P[Distribution system] M --> P N --> P O --> P P --> Q[To consumers] </pre> <p>(Note: Student may show the scheme in different manner, appropriate marks will be given considering components shown in scheme)</p>	(04 Marks)

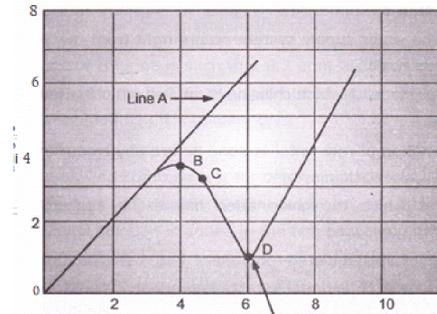

1. A)	(b) Ans.	<p>State acceptable limits of drinking water for the below listed parameters according to IS-10500</p> <table border="1" data-bbox="225 349 778 551"><thead><tr><th>Parameters</th><th>Acceptable limit</th></tr></thead><tbody><tr><td>MPN</td><td>Nil</td></tr><tr><td>Fluoride</td><td>1 mg/lit</td></tr><tr><td>Hardness</td><td>200 mg/lit</td></tr><tr><td>Chlorides</td><td>250 mg/lit</td></tr></tbody></table>	Parameters	Acceptable limit	MPN	Nil	Fluoride	1 mg/lit	Hardness	200 mg/lit	Chlorides	250 mg/lit	(One Mark each)
Parameters	Acceptable limit												
MPN	Nil												
Fluoride	1 mg/lit												
Hardness	200 mg/lit												
Chlorides	250 mg/lit												
1. A)	(c) Ans.	<p>Describe Electrolysis process in advance water treatment.</p> <p>Electrolysis uses ion-selective membranes and an electrical potential difference to separate an ions and cations in solution.</p>  <p>In the past Electrolysis was most often used for purifying brackish water, but it is now finding a role in hazardous waste treatment. Metal salts from plating rinses are sometimes removed in this way. Fig. shows a simple dialysis cell in which waste water may be deionized. As shown in the figure two types of membranes (anionic and cationic) are arranged alternatively to form many compartments between the electrodes placed at the two ends. When the voltage is applied across the cell containing mineralized water, the anions migrate to the positive electrode and the cations migrate to the negative electrode. This causes solution in alternate compartments to become more concentrated while that in the remaining becomes more dilute. The electric power requirement is proportional to the number of ions removed from the water. In the Electrolysis process, organic molecules are not removed and they can collect on and clog the membranes. Another disadvantage of this method is that it still leaves concentrated waste water to be disposed of by some appropriate scheme. The process does not require any chemical additives and has low energy requirements and as such it can be an economically feasible means of demineralisation.</p>	(04 Marks)										
1. A)	(d) Ans.	<p>State break point chlorination & its importance.</p> <p>Water contains the following impurities:</p> <ol style="list-style-type: none">(1) Bacteria.(2) Organic impurities.	(01 Mark)										

Chlorine is required to destroy both bacteria and organic impurities.

(01 Mark)

When chlorine is applied, it first kills the bacteria upto 'B'. Further addition of Cl_2 appears as residual chlorine. The residual chlorine suddenly decreases giving of bad smell and objectionable taste. This indicates that chlorine is used for oxidizing the organic impurities upto point 'C'.

(01 Mark)

The point 'D' at which both the demands are satisfied and residual chlorine increases is called break point. Beyond the break point, any further dose of chlorine gets accumulated. The process of adding chlorine beyond the break point is called break point chlorination.

Significance: (any two)

(01 Mark)

- (1) It completely oxidizes the ammonia and other impurities of water.
- (2) It completely destroys all the disease causing bacteria.
- (3) It removes taste and odour from the water.
- (4) It prevents growth of weeds in water.

1.B)

Attempt any ONE of the following

06 Marks

1.B)

(a)

Explain any two types of intake structure with neat sketch

Ans.

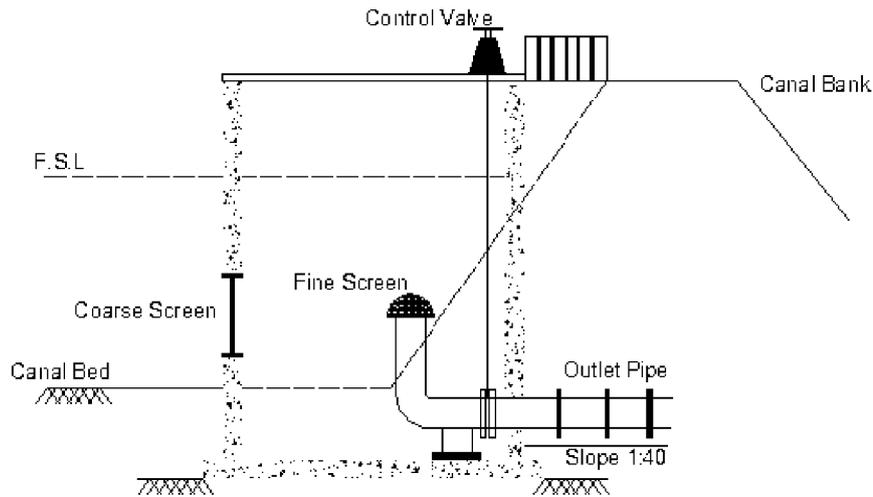

Following are the different types of intake structures:

- i) Canal intake
- ii) Reservoir Intake
- iii) River Intake
- iv) Lake Intake

i) Canal Intake:

A canal intake consists of pipe placed in brick masonry chamber constructed partially in canal bank. On the one side of the chamber, an opening is provided with coarse screen for the entrance of water. The end of the pipe inside the chamber is provided with bell mouth fitted with fine screen. The outlet pipe carries the water to the other side of canal bank, from where it is taken to water treatment plant.

(03 Marks
each for
any two)

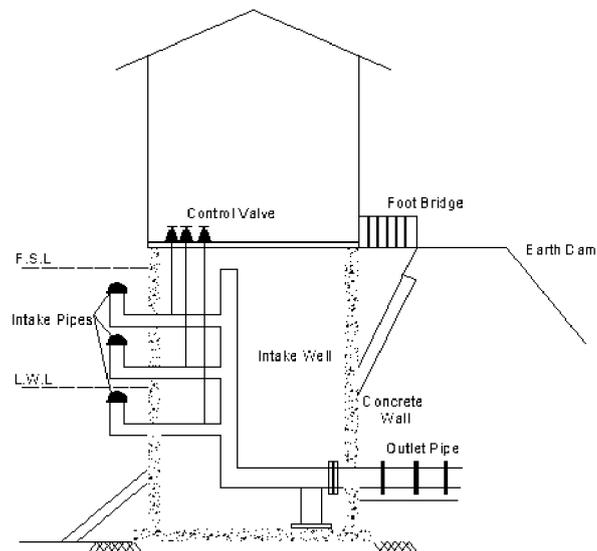

Canal Intake

As the water level in the canal remains more or less constant, there is no need of providing pipes at various levels.

ii) Reservoir Intake:

A reservoir is formed by constructing a dam or weir across the river. The dam may be earthen dam, masonry dam or concrete dam. Since the water level in reservoir changes from time to time, intake pipes are provided at different levels.

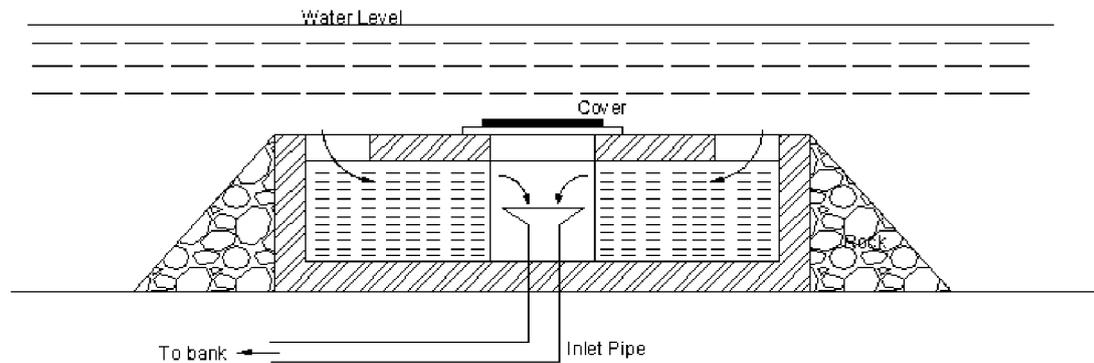

Reservoir Intake

Fig .shows intake tower constructed on the slope of the dam. Screens are provided to the intake pipes and are controlled by sluice valve provided to control water flow.

iii) Lake Intake

For obtaining water from lakes, mostly submersible intakes are used. These intakes are constructed in the bed of the lake, which consists of pipe and bell opening, protected by timber or concrete crib. Water is flow from the opening and is collected in sump well and then pumped to the treatment plant.

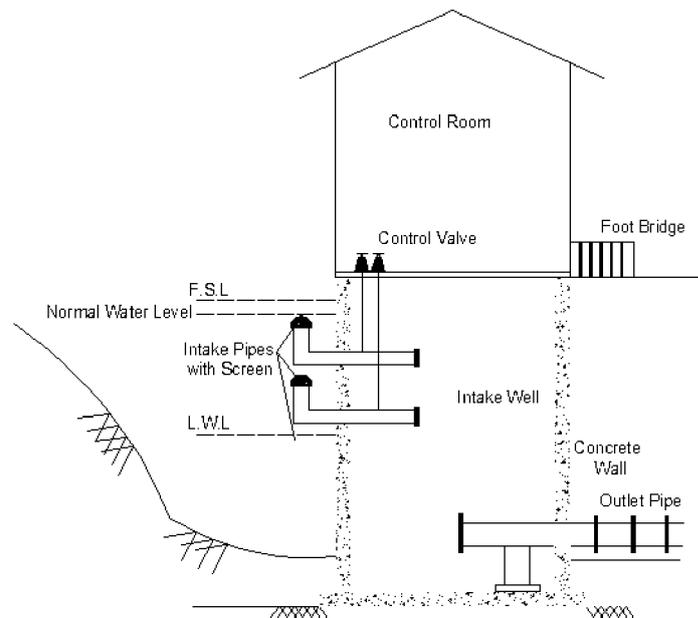

Lake Intake

iv) River Intake:

It is circular masonry tower of 4 to 7 m diameter. It is constructed along the river bank at a place from where water can be drawn in required quantity.

River intake may be,

- a) Wet intake.
- b) Dry Intake.
- c) Movable intake.

River Intake

1.B)	(b) Ans.	<p>Differentiate between slow sand filter and rapid sand filter. (Any six points)</p> <table border="1" data-bbox="236 304 1310 1025"> <thead> <tr> <th>Comparison Points</th> <th>Slow Sand Filter</th> <th>Rapid Sand Filter</th> </tr> </thead> <tbody> <tr> <td>1. 2.		<p>Attempt any FOUR of the following</p>	16 Marks																																				
2.	a) Ans.	<p>Describe factors affecting water demand.</p> <p>i) Size of city: Per capita demand of water is generally more for large cities, since commercial and industrial developments takes place in them.</p> <p>ii) Habits of people: The use of water depends upon living standards of the consumer. This depends upon economic status of the people.</p> <p>iii) Climatic conditions : At places where summer are hot and dry , the consumption of water is more as more quantity is used for bathing, air coolers, sprinkling lawns and gardens.</p> <p>iv) Cost of water: If the cost of water is more, the consumption will be less and vice versa.</p> <p>v) Commerce and industry: Presence of industry increases per capita demand. It also varies with the type of industry .</p> <p>vi) Quality of water: If quality and taste of water is good, consumption will be more. The people will not use other sources like well water.</p> <p>vii) Efficiency of water supply system: If system is efficient, the pressure in distribution pipes will be high, causing more consumption. Losses through faulty plumbing will also more.</p> <p>viii) System of sanitation: If underground drainage system is provided in the town, more quantity of water is used in flushing water closet and urinals.</p> <p>ix) System of supply: The water supply to a city may be intermittent or continuous. In general the consumption is less in intermittent system.</p> <p>x) Metering of supply: Metering reduces the consumption since the people know that they have to pay more for the losses and wastages caused by them.</p>	(One Mark each for any four points)																																				

2.	b) Ans.	<p>Describe principle of coagulation with its process.</p> <p>Coagulants are chemical, added to water to remove the colloidal particles or impurities of raw water and reduce turbidity of water. Principle of coagulation can be explained by two considerations.</p> <p>a) Floc formation b) Electrical charges.</p> <p>(a) Floc formation: When a coagulant is added to water and mixed thoroughly and thick gelatinous precipitate 'Floc' is formed. Floc attracts and arrests the colloidal particles and makes them settle down.</p> <p>(b) Electrical charges: Ions from floc possess positive electric charge. Colloidal particles possess negatively charged ions. The floc thus attracts colloidal particles and makes them settle down.</p>	<p>(02 Marks)</p> <p>(02 Marks)</p>								
2.	c) Ans:	<p>Discuss an importance of prevention of bores & borewell water source.</p> <p>Bore water is groundwater that has been accessed by drilling a bore into underground aquifers (water storages) and pumping to the surface. Avoiding contamination is important because bore water that becomes polluted can be difficult and expensive to treat. Ways you can prevent your bore water from becoming contaminated include:</p> <p>i) Keep septic tanks well maintained and don't discharge septic waste within 50 metres of the bore</p> <p>ii) Avoid chemical spills or excessive use of chemicals such as fertilizers</p> <p>iii) Protect the bore from livestock access by erecting fencing to allow at least a 50 metre clear zone around the bore</p> <p>iv) Seal the bore to prevent surface water or shallow ground water from contaminating the ground water</p> <p>v) Once the ground water is pumped to the surface, protect the water through properly maintained, enclosed water systems and storage tanks</p> <p>vi) Use backflow prevention devices</p> <p>(Note: Students may write other appropriate points regarding importance of bores & borewell water source)</p>	<p>(01 Mark each) Any Four</p>								
2.	d) Ans.	<p>Differentiate between dead end system and circular system.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Dead End System</th> <th style="width: 50%; text-align: center;">Circular System</th> </tr> </thead> <tbody> <tr> <td>The discharge and pressure head at any point in the system can be easily calculated.</td> <td>The discharge and pressure head at any point in the system can not be easily calculated.</td> </tr> <tr> <td>Cut-off valves required in this system is less.</td> <td>Cut-off valves required in this system is more.</td> </tr> <tr> <td>During break down large area is affected.</td> <td>During break down, water can be supplied from other pipelines.</td> </tr> </tbody> </table>	Dead End System	Circular System	The discharge and pressure head at any point in the system can be easily calculated.	The discharge and pressure head at any point in the system can not be easily calculated.	Cut-off valves required in this system is less.	Cut-off valves required in this system is more.	During break down large area is affected.	During break down, water can be supplied from other pipelines.	<p>(01 Mark each) Any Four</p>
Dead End System	Circular System										
The discharge and pressure head at any point in the system can be easily calculated.	The discharge and pressure head at any point in the system can not be easily calculated.										
Cut-off valves required in this system is less.	Cut-off valves required in this system is more.										
During break down large area is affected.	During break down, water can be supplied from other pipelines.										

		Suitable for localities which expand irregularly.	Suitable for the well planned area.
		This system is cheap and economical.	Cost is more.

2.	e)	<p>Describe recycle and reuse of domestic sewage.</p> <p>Reuse of wastewater for domestic and agricultural purposes has been occurring since historical times. Reuse of wastewater for water-demanding activities, which, so far consumed limited freshwater resources is, in effect, imitating the natural water cycle through engineered processes. Following are the advantages of recycle and reuse of domestic sewage.</p> <p>i) It reduced load on wastewater treatment plant. ii) It helps in preventing pollution of natural streams and rivers. iii) Cost of sewage collection and treatment is less. iv) Reduce the demand of city and helps I conservation of water.</p> <p><i>(Note: Students may write other appropriate points regarding recycle and reuse of domestic sewage)</i></p>	(01 Mark each)Any Four
-----------	-----------	--	-------------------------------

2.	f)	<p>Draw a line plan showing water supply arrangement in residential buildings.</p>	(04 Marks)
-----------	-----------	---	-------------------

3.	Attempt any FOUR of the following :	16 Marks
-----------	--	-----------------

3.	a)	<p>Define terms :</p> <p>i) Sullage pipe: sullage pipe is used to receives and conveys waste water from bathroom, Kitchen, wash basin etc. As the organic matter is absent or negligible it does not Create bad smell.</p> <p>ii) Soil pipe: - The pipe which receives and conveys discharge from soil fittings Such as water closet, urinal etc. is called as soil pipe.</p> <p>iii) Vent pipe: - The pipe installed for ventilation is called vent pipe. This pipe Prevents siphonic action in system and releases pressure of foul gases.</p> <p>iv) Sewage: it includes all liquids waste of a community. This sewage is extremely foul in nature, it creates bad smell.</p>	01 M for each
-----------	-----------	---	----------------------

3.	b)	Differentiate between treatments required for surface and subsurface sources of water used for domestic purpose.			
	Ans.	Treatment	Surface source	Sub-surface source	
		Screening	It is required to remove floating matter present.	Not essential	

		Aeration	Required as various gases are dissolved.	Not essential, required only if sub surface water contains organic impurities.	Any four 01 M for each												
		Sedimentation	Plain sedimentation or sedimentation with coagulation is used depending upon size of solid particles.	Not essential as there is less chances of presence of suspended solids.													
		Filtration	Normally rapid sand filter is used.	Slow sand filter is used as bacterial removal efficiency is more.													
		Disinfection	Essential.	Essential.													
3.	c) Ans.	<p>Describe principles of building drainage system. Explain general principles of building drainage. i. The drain should be laid in such a way so as to remove the sewage quickly from the building. The drain should be laid at such a slope that self-cleaning velocity is developed in them. ii. All the drainage system should be properly ventilated on the house sides. All the inspection chambers should be provided with fresh air inlets. iii. All the drains should be laid in such a way so as to ensure their safety in future. iv. The drain should be laid in such a way that in future extension can be done easily if desired. v. All the rain water pipes, sweeping from house and bath water should be discharged over gully traps and should be connected from the drain. vi. All soil pipes should be carried direct to the manholes without gully traps.</p>			Any four 01 M for each												
3.	d) Ans.	<p>Compare four points of plain sedimentation and sedimentation with coagulation.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Sr.No.</th> <th style="width: 40%;">plain sedimentation</th> <th style="width: 50%;">sedimentation with coagulation</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">1</td> <td>Simple, low cost technology to reduce settable solids and Perhaps some microbes for water. Very fine suspended particles are not removed by plain sedimentation. Silt particles 0.06 mm size require 10 hrs. To settle in 3m deep plain sedimentation tank and 0.002 m particle will require about 4 days for settling.</td> <td>Accurate methods, sedimentation with coagulation process are acting simultaneously one after another so requires less time as compare to plain sedimentation.</td> </tr> <tr> <td style="text-align: center;">2</td> <td>Removal of settable solids can reduce turbidities and make the water more amenable to other treatment methods to reduce microbes</td> <td>When coagulants chemicals e.g. ferrous sulphates or alum, are added to water and insoluble, gelatinous, flocculent precipitation is formed this gelatinous precipitate during its formation.</td> </tr> <tr> <td style="text-align: center;">3.</td> <td>Coagulant is not use.</td> <td>3. Coagulant are use</td> </tr> </tbody> </table>			Sr.No.	plain sedimentation	sedimentation with coagulation	1	Simple, low cost technology to reduce settable solids and Perhaps some microbes for water. Very fine suspended particles are not removed by plain sedimentation. Silt particles 0.06 mm size require 10 hrs. To settle in 3m deep plain sedimentation tank and 0.002 m particle will require about 4 days for settling.	Accurate methods, sedimentation with coagulation process are acting simultaneously one after another so requires less time as compare to plain sedimentation.	2	Removal of settable solids can reduce turbidities and make the water more amenable to other treatment methods to reduce microbes	When coagulants chemicals e.g. ferrous sulphates or alum, are added to water and insoluble, gelatinous, flocculent precipitation is formed this gelatinous precipitate during its formation.	3.	Coagulant is not use.	3. Coagulant are use	01 M for each point
Sr.No.	plain sedimentation	sedimentation with coagulation															
1	Simple, low cost technology to reduce settable solids and Perhaps some microbes for water. Very fine suspended particles are not removed by plain sedimentation. Silt particles 0.06 mm size require 10 hrs. To settle in 3m deep plain sedimentation tank and 0.002 m particle will require about 4 days for settling.	Accurate methods, sedimentation with coagulation process are acting simultaneously one after another so requires less time as compare to plain sedimentation.															
2	Removal of settable solids can reduce turbidities and make the water more amenable to other treatment methods to reduce microbes	When coagulants chemicals e.g. ferrous sulphates or alum, are added to water and insoluble, gelatinous, flocculent precipitation is formed this gelatinous precipitate during its formation.															
3.	Coagulant is not use.	3. Coagulant are use															

		4.	Recommended as a simple pre-treatment of household water prior to application of other treatments to reduce microbes	Recommended as a accurate treatment of public water supply prior to application of other treatments to reduce suspended ,colloidal matters and microbes.	
--	--	----	--	--	--

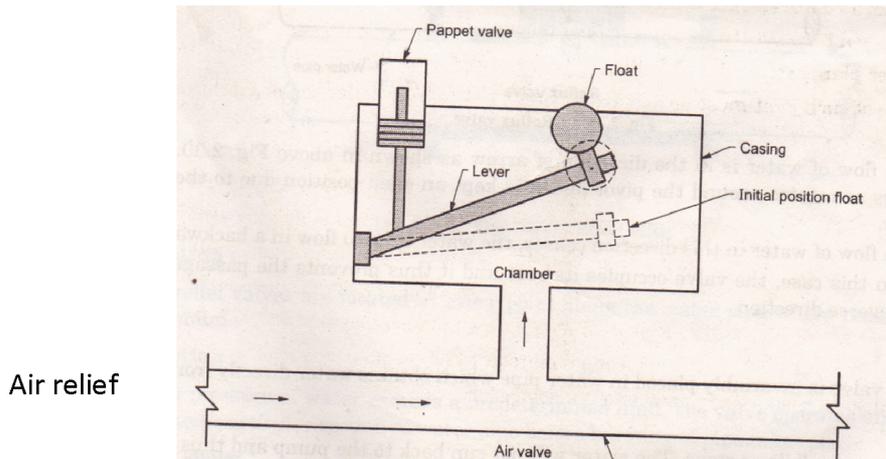

3.	e) Ans.	Describe terms	<p>i) Self-Cleaning velocity: - The minimum velocity which will prevent the silting or deposition of particles of solid matter in sewers is known as self-cleaning velocity. The gradient of sewer should be such that this velocity is developed at least once in a day preferably twice in a day. Usually it is 800mm to 900mm per second for normal sewage</p> <p>ii) Non-Scouring velocity: - The maximum permissible velocity at which no scouring act by the solid particles of sewage on inside smooth surface of sewers will occur is known as Non-scouring velocity. It mainly depends on material of sewer.</p>	<p>02 M</p> <p>02 M</p>
----	------------	-----------------------	---	---------------------------------------

4.	A	Attempt any THREE of the following	12 Marks
----	---	---	-----------------

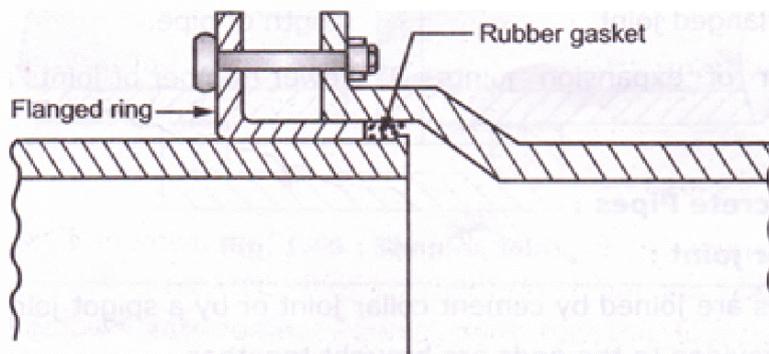

4.	A)a) Ans.	Describe with neat sketch on inspection chamber.	<p>Inspection chambers are provided at all changes of direction for the inspection chamber and cleansing of drain or sewer. They are constructed with concrete bed and brick or RCC walls. RCC slab is provided at the top in which manholes or cleansing eye is provided. Inspection chambers are generally square or rectangular in shape.</p>	(02 Marks)
				(02 Marks)

4.	A)b) Ans.	Differentiate between Indian and European type of water closet.	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Indian water closet</th> <th style="width: 50%; text-align: center;">European water closet</th> </tr> </thead> <tbody> <tr> <td>Require more space for installation.</td> <td>Require less space for installation.</td> </tr> <tr> <td>It is two piece construction i.e. pan and trap.</td> <td>It is one piece construction of pan and trap.</td> </tr> <tr> <td>Require more water for flushing.</td> <td>Require less water for flushing.</td> </tr> <tr> <td>No cover is provided at top.</td> <td>Cover is provided at top.</td> </tr> </tbody> </table>	Indian water closet	European water closet	Require more space for installation.	Require less space for installation.	It is two piece construction i.e. pan and trap.	It is one piece construction of pan and trap.	Require more water for flushing.	Require less water for flushing.	No cover is provided at top.	Cover is provided at top.	(01 Mark each for any four points)
Indian water closet	European water closet													
Require more space for installation.	Require less space for installation.													
It is two piece construction i.e. pan and trap.	It is one piece construction of pan and trap.													
Require more water for flushing.	Require less water for flushing.													
No cover is provided at top.	Cover is provided at top.													

4.	A)c) Ans.	Draw neat sketch of i) Air relief valve ii) Expansion joint	
----	--------------	--	--

(02 Marks)

(02 Marks)

Expansion Joint

4. A)d) **Design circular sewer pipe for following data: Population – 70,000 , Rate of water supply – 135 lpcd, $N = 0.015$ and Max flow = 2 x average flow.**

Ans.

Population= 70000

Rate of water supply = 135 lpcd

$i = 1/400$ (assume)

Average water supply = (m³/sec)

$= 70000 \times 135 / 24 \times 60 \times 60 \times 1000$

$= 0.109375 \text{ m}^3/\text{sec}$

Max discharge of sewage produced = $2 \times 0.109375 = 0.21875 \text{ m}^3/\text{sec}$

$Q = AV$

$Q = 0.21875 \text{ m}^3/\text{sec}$

$A = (\pi/4) \times D^2$

$A = (\pi/4) \times D^2 = 0.785 D^2$

$Q = (1/N) \times m^{2/3} \times i^{1/2}$

1. RUNNING FULL ($m = D/4$)

$0.21875 = (1/0.015) \times (D/4)^{2/3} \times (1/400)^{1/2}$

$D = 0.06 \text{ m}$

(02 Marks)

(02 Marks)

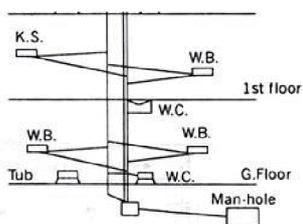

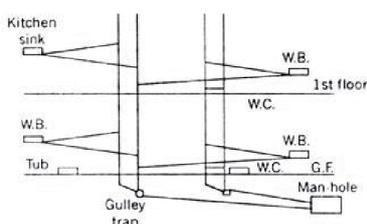

4. B **Attempt any ONE of the following**

06 Marks

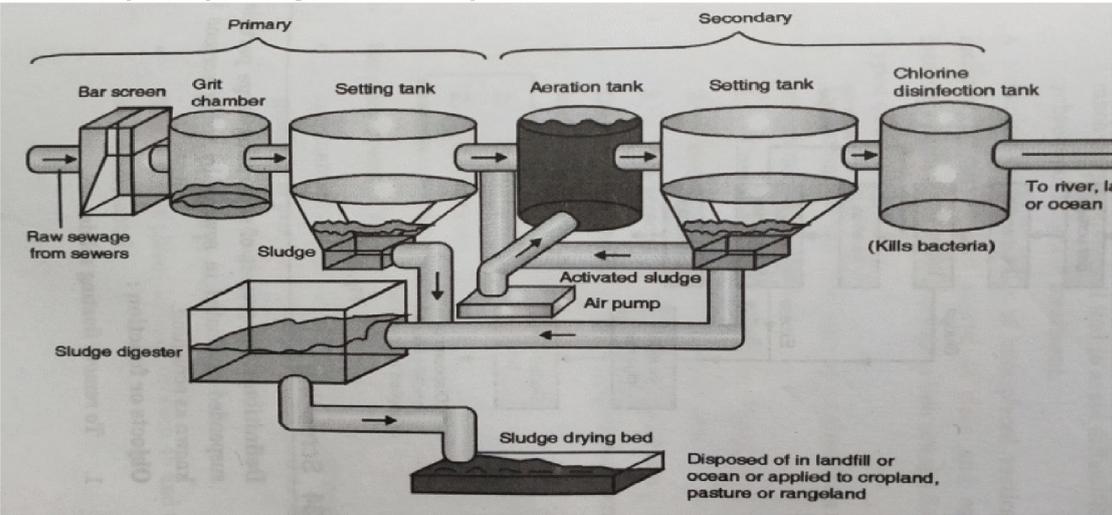

4. B)a) **Estimate probable population for data provided for year 2031 and 2041 using incremental increase method.**

Year	Population
1991	9,876

5 e. Ans

Explain importance of rain water harvesting.

Importance of rain water harvesting –

- 1) Surface water is inadequate to meet our demand and we have to depend on ground water.
- 2) To arrest ground water decline and augment ground water table.
- 3) To beneficiate water quality in aquifer.
- 4) To conserve surface water runoff during monsoon.
- 5) To reduce soil erosion.
- 6) Due to rapid urbanization, infiltration of rain water into the sub-soil has decreased drastically and recharging of ground water has diminished.

5 f. Ans

Differentiate between aerobic and anaerobic process for sewage treatment.

Points	Aerobic process	Anaerobic process
i) Process	In the presence of oxygen.	In the absence of oxygen.
ii) Organism involved	Aerobic bacteria.	Anaerobic bacteria.
iii) Oxygen source for bacterial metabolism	Dissolved oxygen initially present or supplied to the waste by some means.	Chemically bound oxygen such as Nitrates, sulphates, CO ₂ , organic compounds etc.
iv) End Product	CO ₂ , H ₂ O.	CH ₄ , CO ₂ , H ₂ S, etc.
v) Economical Product	No methane gas recovery.	Methane gas produces in this process.
vi) Nuisance due to end products	Inoffensive.	Offensive.
vii) Applicability of Process	Moderate waste.	Strong organic waste.
viii) Effectiveness process	End product requires some treatment.	Well stabilized end product.

c.
Ans

Explain any two methods of distribution system.

Methods of distribution system -

1. Gravity System: In this system, the water is conveyed through pipes by gravity only. This gravity system is the most reliable method of distribution. But it is useful only when the source of water supply is situated at a higher level than that of the distribution area. The fig. shows the gravity system with hydraulic gradients during maximum and minimum demands.

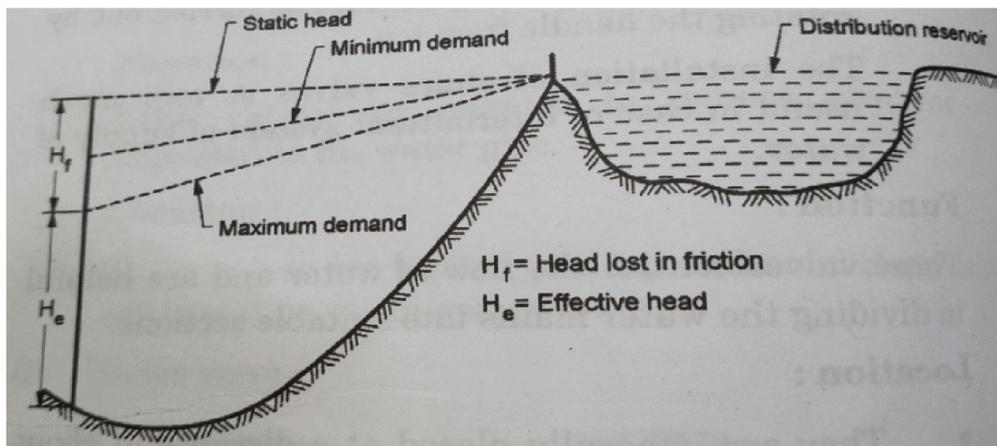

Fig. – Gravity system

2. Gravity And Pumping System. This is also known as a combined gravity and pumping system. The pump is connected to the mains as well as to an elevated reservoir. In the beginning, when demand is small, the water is stored in the elevated reservoir, but when demand increases, the rate of pumping, the flow in the distribution system comes from both the pumping station as well as the elevated reservoir. As in this system, water comes from two sources: one from the reservoir and the second from the pumping station, it is called a dual system. This system is more reliable and economical because it requires a uniform rate of pumping but meets both low as well as maximum demand. The water stored in the elevated reservoir meets the requirements of demand during breakdown of pumps and for fire fighting. Fig. shows this system with hydraulic gradient lines for minimum and maximum draft. This system is usually adopted everywhere.

Any two
02 M for
each

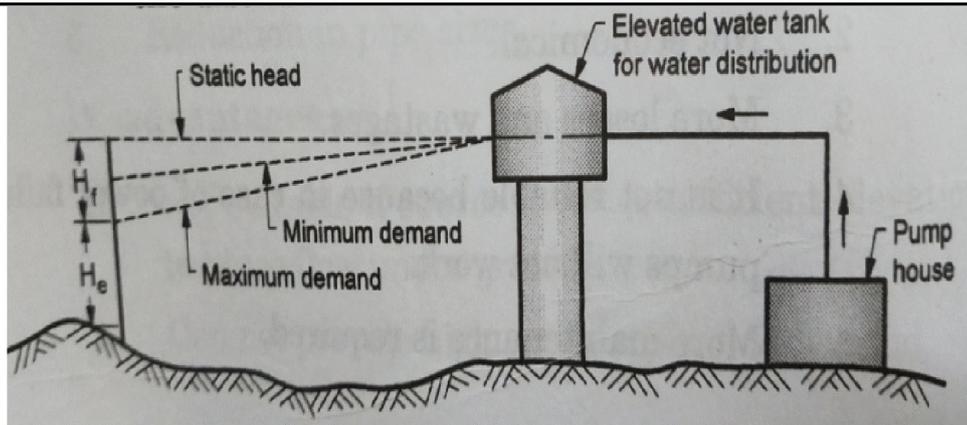

Fig. – Combined gravity & pumping system.

3. Pumping System: In this system water is directly pumped in the mains. Since the pumps have to work at different rates in a day, the maintenance cost increases. It is preferred to have number of pumps and only the required numbers may work at various times to meet the varying demand, in place of providing pump of variable speed. High lift pumps are required and their operations are continuously watched. If the power fails, the whole supply of the town will be stopped. Therefore, it is better to have diesel pumps also in addition to the electric pumps as stand by. During fires, the water can be pumped in the required quantity by the stand-by units also. But this system is not preferred than other systems. The required pressure maintained in the pipe line is by direct pumping as shown in Fig

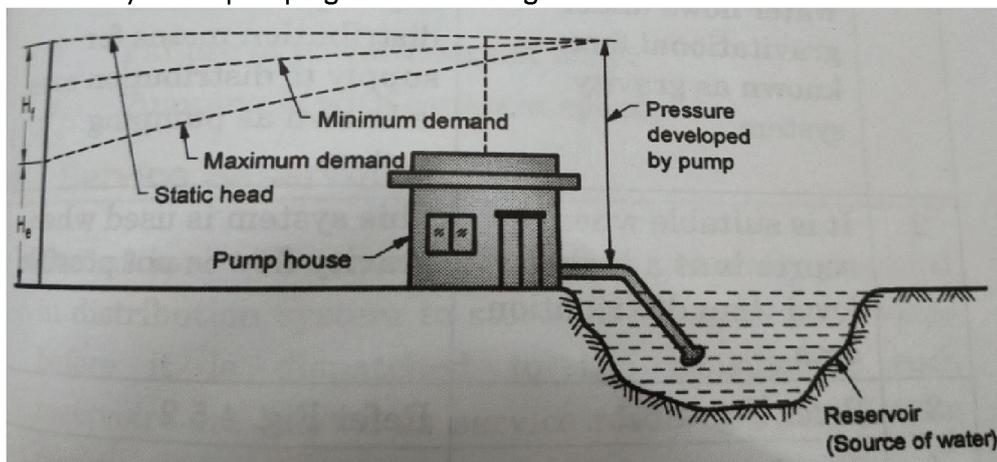

Fig. – Pumping system.

Note:- Students can write any two method.

6

d.
Ans

Describe testing of sewer pipes.

- i) **Water Test** – 1) This test is carried out for sewer lines between two manholes.
- 2) Plugging is done by rubber plug at its lower end.
- 3) Rubber plug is connected with air blown.
- 4) The upper end of sewer is plugged with a connection to the funnel.
- 5) The sewer is filled with water and to maintain the required head, water level in the funnel is kept 2 m above the upper end. This head varies with the material of sewer.
- 6) In case of cast iron sewer, the head should be at 9m.
- 7) The acceptable loss or head loss should not exceed 2 litres/cm of length of the sewer.
- 8) To perform this test sufficient amount of water should be available.
