

#### SUMMER-22 EXAMINATION Model Answer

Subject Title: Chemistry of Engineering materials

Subject code :

22233

Page 1 of 24

### **Important Instructions to examiners:**

- The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills.
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students in first year (first and second semesters) write answers in Marathi or bilingual language (English +Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

|-------|---------|--|-----------------|
| 1     | d       | (a) Define corrosion with example.   |                 |
|       |         | Ans. <u>Corrosion - Definition</u> –   | 1               |
|       |         | • Corrosion is the gradual deterioration or destruction of materials (usually metals         |                 |
|       |         | and alloys) by chemical or electrochemical reactions with its environment.                   |                 |
|       |         | • Corrosion is defined as the gradual deterioration or destruction of a metal by             |                 |
|       |         | chemical or electrochemical reactions with its environment.                                  |                 |
|       |         | • Any process of deterioration and consequent loss of a solid metallic material              |                 |
|       |         | through undesired chemical or electrochemical attack by its environment starting at          |                 |
|       |         | the surface.   |                 |
|       |         | Example –  | 1 Mark          |
|       |         | 1. Rusting of iron (i.e. the formation of iron oxide $Fe_2O_3.H_2O$ ) when exposed to        | for any         |
|       |         | atmospheric conditions.  | 1               |
|       |         | 2. Formation of green film of basic carbonate $CuCO_3+Cu(OH)_2$ on the surface of            |                 |
|       |         | copper when exposed to moist air containing CO <sub>2</sub> .                                |                 |
| 1     | e       | Give the meaning of pig iron and cast iron.  |                 |
|       |         | Pig Iron – It is a semi finished product produced in the form of a chunky moulded            | 1               |
|       |         | blocks known as pigs, by heating an iron ore in a blast furnace.                             |                 |
|       |         | It contains about 91-94% Fe and high amounts of carbon , typically 3.5 to 4.5% along         |                 |
|       |         | with small amounts of P , Mn , Si and S.   |                 |
|       |         | Cast Iron – It is primarily comprised of iron (Fe) , carbon (C) and silicon (Si).In addition | 1               |
|       |         | it also contains traces of sulphur , manganese (Mn) and phosphorous (P). The carbon          |                 |
|       |         | content of cast iron ranges from 2 to 4.5% and its silicon content ranges from 0.5 to        |                 |
|       |         |  |                 |
|       |         | 3%.  |                 |

| 2 | a | Explain thermal insulator and electrical insulator with example.                       |   |
|---|---|--|---|
|   |   | <u>Thermal Insulators</u> –  |   |
|   |   | • The process of insulating against transmission of heat is called heat insulation and | 1 |
|   |   | the materials are known as thermal insulating materials.                               |   |
|   |   | • A material of relatively low thermal conductivity is used to cover a volume against  |   |
|   |   | loss or entrance of heat by conduction , convection and radiation.                     |   |
|   |   | • The insulating capacity of a material is measured in terms of thermal conductivity   |   |
|   |   | of the material.Low thermal capacity is equivalent to high insulating capacity.        |   |
|   |   | Insulating materials conserve energy by reducing heat loss or gain , lower energy      |   |
|   |   | bills/reduce energy costs , control surface temperatures for personnel protection      |   |
|   |   | and comfort , reduce emissions of pollutants to the atmosphere/reduce                  |   |
|   |   | greenhouse emissions , provide comfortable/acceptable living/working                   |   |
|   |   | environment, enhance process performance and reduce noise levels.                      |   |
|   |   | Examples:  |   |
|   |   | Commonly used thermal insulating materials are glass wool (fiber glass) ,              | 1 |
|   |   | polyurethane foam , ceramic wool , cork , expanded rock wool , slag wool ,             |   |
|   |   | polystyrene (thermocol) , extruded polystyrene foam.                                   |   |
|   |   | Electrical Insulators –  |   |
|   |   | • Electrical shocks caused by the flow of current through the human body can result    |   |
|   |   | in injuries, disablement or death.D.C. voltage upto 40 volts and A.C. voltage upto     |   |
|   |   | 60 volts are considered as safe limits to the human body. Electricity is considered    | 1 |
|   |   | as a hazard beyond these limits and to prevent it , electrical insulation is required. | - |
|   |   | • An insulating material used to cover electrical wires, cables or other equipments is |   |
|   |   | called electrical insulation.  |   |
|   |   | • A material which does not allow the electricity to pass through it is called as an   |   |
|   |   | insulating material. A material that is unable to conduct electricity due to its very  |   |
|   |   | high electrical resistivity is called as an electrical insulator/insulating material.  |   |

|--------|----------|---|-----------------------------|
|        |          | <ul> <li>Electrical insulating materials are usually used as protective coatings on electrical wires and cables , electrical machines as bushings for high voltage overhead transmission lines etc.</li> <li>Examples:         <ul> <li>Materials like ceramic , mica impregnated paper , porcelain , epoxy resin , polystyrene , polyester resin , silicone , polyurethane , butyl rubber silicone rubber , polyethylene , polyvinyl chloride , cross-linked polyethylene , teflon and fiber glass are very good electrical insulators.</li> </ul> </li> </ul> | 1                           |
| 2      | b        | Define chemical reactivity.Explain it with air , water and acid.         Definition -Chemical reactivity is the ability of a material to combine with other   | 1                           |
|        |          | materials such as water , air , acids , steam etc.<br>With Air – e.g. mild steel reacts with air to form iron oxide ( $Fe_2O_3$ ) – mild steel<br>reacts with oxygen from air in the presence of moisture or dissolved oxygen from  | 1                           |
|        |          | water to produce hydrated iron oxide Fe <sub>2</sub> O <sub>3</sub> .xH <sub>2</sub> O.<br>With Water – stainless steel does not react with water (i.e. stainless steel resists attack by air and water) due to the presence of a passive film of chromium oxide  |                             |
|        |          | ( $Cr_2O_3$ ) on its surface. This film is protective , stable , invisible , tightly adhered to<br>the surface. i.e. it will not flake-off and self healing. If the surface is scratched then<br>also the film of $Cr_2O_3$ will quickly be formed on its surface. This chromium oxide<br>film acts as a barrier that prevents the access of oxygen and water to the  | 1                           |
|        |          | underlying metal surface and consequently prevents further reaction of the material surface with air and water.   |                             |
|        |          | <ul> <li>With acid –</li> <li>1. Iron (mild Steel) does not react with commercial grade sulphuric acid i.e. with conc. Sulphuric acid.</li> <li>2. Iron (mild Steel) reacts with dilute sulphuric acid producing ferrous</li> </ul>   |                             |

| 2     | d         | Explain corrosion in acidic and alkaline en   | nvironments.                     |                       |                  |
|       |           | Corrosion in acidic medium :  |                                  |                       |                  |
|       |           | An acidic environmer  | nt refers to an environment      | having a pH value     | of 2             |
|       |           | less than seven. Ac   | idic environments are m          | ore prone to caus     | se               |
|       |           | corrosion than alkalin  | e and neutral environment        | S.                    |                  |
|       |           | When an acid reacts with the second sec | with a metal , salt is produc    | ed with the evolution | n                |
|       |           | of hydrogen gas. The  | general chemical reaction        | between an acid ar    | d                |
|       |           | a metal is ,  |                                  |                       |                  |
|       |           | Metal + Acid → Sa   | alt + Hydrogen gas               |                       |                  |

| ect Title: | Chemistry of Engineering materials Subject code : 22233                              | Page <b>10</b> of <b>24</b> |
|------------|--|-----------------------------|
|            | e.g. $Zn + H_2SO_4 \rightarrow ZnSO_4 + H_2$   |                             |
|            | • Acid contains H+ ions and tend to accept electrons. They tend to grab              |                             |
|            | electrons and form hydrogen gas. Metals give up electrons and from                   |                             |
|            | metal ions.  |                             |
|            | $Fe \rightarrow Fe^{2+} + 2e^{-}$ and $2H^+ + 2e^{-} \rightarrow H_2$                |                             |
|            | • Thus , when we put an iron nail in an acid , the $H^+$ ions present in the         |                             |
|            | acid grab electrons from the iron. Iron gives up electrons and gets                  |                             |
|            | converted into soluble Fe <sup>2+</sup> ions and the solid material (nail) gradually |                             |
|            | disappears. The electrochemical reaction is ,  |                             |
|            | $Fe + 2H^+ \rightarrow Fe^{2+} + H^2$  |                             |
|            | Corrosion in alkaline medium:  |                             |
|            | Cathodic reaction is : absorption of oxygen  |                             |
|            | $O_2 + 2H_2O + 4 e^- \rightarrow 4 OH^-$   |                             |
|            | Corrosion is less in alkaline medium   |                             |
|            | • Example of alkaline medium is NaCl solution, e.g. a piece of iron is               | 2                           |
|            | immersed in sodium   |                             |
|            | chloride solution  |                             |
|            | $Fe \rightarrow Fe^{2+} + 2e^{-}$  |                             |
|            | $NaCl \rightarrow Na^+ + Cl^-$   |                             |
|            | $\frac{1}{2}O_2 + H_2O + 2e^- \rightarrow 2 OH^-$                                    |                             |
|            | $Na^+ + OH^- \rightarrow NaOH$   |                             |

|       |          | Austenitic Stainless Steels         Uses:         It is used for process equipments, piping, valves, fittings and flanges in milk         processing (dairy), wine making brewing, fruit juice and chemical industry.         In chemical industry it is used especially for process equipments for nitration         plants. It is used for storage tanks tankers and containers.         It is used for handling nitric acid, phosphoric acid, citric acid, dyestuffs, crude and         refined oils and organic and inorganic chemicals. |                   |

|------|----------|---|------------------|
|      |          | divided by its cross-sectional area   |                  |
| 6    | b        | Resistivity   | 3                |
| 0    | 0        | The resistivity of a material is a measure of its resisting power to the flow of an       | 5                |
|      |          | electric current  |                  |
|      |          | The resistivity of a material is the resistance of a wire of that material of unit length |                  |
|      |          | and unit cross-sectional area of the flow of electric current                             |                  |
|      |          | Resistivity is the reciprocal of conductivity. Thus, a material that has a high           |                  |
|      |          | resistivity will have a low (electrica conductivity and vice versa.                       |                  |
|      |          | The resistivity (also known as specific resistance) depends on the nature and             |                  |
|      |          | temperature of a material. A good conductor has a low resistivity, while a bad            |                  |
|      |          | conductor has a high resistivity. The SI unit of resistivity a ohm meter (ohm.m)          |                  |
|      |          | (Resistivity) = $(V/I) * (A/L)$   |                  |
|      |          | V=Voltage   |                  |
|      |          | I= Current  |                  |
|      |          | A = c/s Area  |                  |
|      |          | L= length   |                  |
|      |          | Unit is = Ohm.cm  |                  |
|      |          | Conductivity (Electrical Conductivity)  |                  |
|      |          | Is a measure of the ability of a material to conduct an electric current (or to conduct   |                  |
|      |          | electricity).   |                  |
|      |          | Electrical conductivity is also known as specific conductance and has SI units of         |                  |
|      |          | siemen per meter (S /m). Electrical Conductivity can flow easily through a                | 3                |
|      |          | material having a high conductivity. For example, copper,                                 |                  |
|      |          | As per order of conductivity, we have conductors-copper, alumiinium,                      |                  |
|      |          | semiconductors-silicon and insulators   |                  |
|      | 1        |   |                  |
