

SUMMER-22 EXAMINATION
Model Answer

Subject title: Chemical Process Instrumentation & Control

Subject code

22407

Page 1 of 21

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students in first year (first and second semesters) write answers in Marathi or bilingual language (English +Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

Q No.	Answer	Marking scheme
1	Attempt any five	10
1 a	<p>Principle of Positive displacement meter:</p> <p>As the liquid flows through the meter, it separates the flow of liquid into separate known volumetric increments which are counted and totaled. The sum of the increments gives the measurement of the total volume of liquid passed through the meter.</p> <p style="text-align: center;">(OR)</p> <p>These meters have two chambers of known volumetric capacity and they are arranged so that when one chamber is being filled, the other is being emptied. For measuring the total flow over a certain period, the fluid is continuously filled and emptied from the chamber and then the number of times the chamber is being filled and emptied in that period is counted which when multiplied by the volumetric capacity of the chamber gives the total flow.</p>	2
1 b	<p>Diagram of Metallic diaphragm gauge</p> <p>The diagram illustrates a metallic diaphragm gauge. It consists of a cylindrical body with a diaphragm in the center. The diaphragm is connected to a lever mechanism that moves a pointer across a scale. The gauge is labeled with 'Scale', 'Opposing Calibrating Spring', 'pointer', 'Diaphragm', 'Low pressure (P₁)', and 'High pressure (P₂)'.</p>	2

2	c	<p>Factors to be considered for valve selection(any four) :</p> <p>The basic steps in control valve selection are</p> <ol style="list-style-type: none">1. The first step in control valve selection involves collecting all relevant data and completing the ISA Form S20.50. The piping size must be set prior to valve sizing, and determining the supply pressure may require specifying a pump2. The size of the valve is required; select the smallest valve Cv that satisfies the maximum Cv requirement at 90% opening. While performing these calculations, checks should be made regarding flashing, cavitation, sonic flow and Reynolds number to ensure that the proper equation and correction factors are used. As many difficulties occur due to oversized valves as to undersized valves. Adding lots of “safety factors” will result in a valve that is nearly closed during normal operation and has poor rangeability.	1 mark each

		<p>3. The trim characteristic is selected to provide good performance; goals are usually linear control loop behaviour along with acceptable rangeability.</p> <p>4. The valve body can be selected. The valve size is either equal to the pipe size or slightly less, for example, a 3-inch pipe with a 2-inch globe valve body. When the valve size is smaller than the process piping, an inlet reducer and outlet expander are required to make connections to the process piping.</p> <p>5. The actuator is now selected to provide sufficient force to position the stem and plug.</p> <p>6. Finally, auxiliaries can be added to enhance performance. A booster can be increase the volume of the pneumatic signal for long pneumatic lines and large actuators. A positioner can be applied for slow feedback loops with large valves or valves with high actuator force or friction. A hand wheel is needed if manual operation of the valve is expected.</p>

5	a	<p>Magnetic flow meter:</p> <p>Construction:</p> <p>It consists of a permanent magnet or electromagnet which may be either ac or dc around a non-conducting nonmagnetic pipe. It is insulated from the conducting fluid by glass lining so as to prevent the short circuiting of emf between the electrodes. Two electrodes are placed at right angles to the magnetic field for picking up the induced emf.</p> <p>Diagram</p>	2

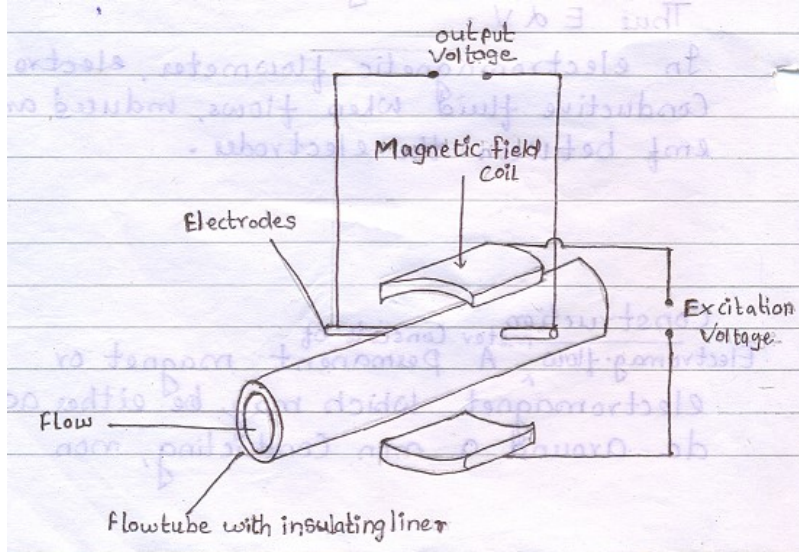

SUMMER-22 EXAMINATION
Model Answer

Subject title: Chemical Process Instrumentation & Control

Subject code

22407

2

Working

As the conducting fluid flows through the pipe, due to the magnetic field around the pipe, an emf is induced between the electrodes. The induced emf is given by

$$E = Blv \text{ where } E \text{-emf}$$

l-Length of conductor

B-Magnetic flux density

v-Velocity of conductor

This emf induced is proportional to the velocity of the conductor. As the flow rate varies, velocity of fluid changes and hence the induced emf changes.

5	c	<p>Radiation pyrometer:</p> <p>Construction: It consists of a lens, diaphragm, radiation receiving element, sighting hole and recorder or indicator. Lens is used to concentrate the radiant energy from the hot source on the diaphragm and on the thermopile. Sighting glasses enable the proper line of sight and proper focus to be established.</p> <p>Diagram:</p>	<p>2</p>

SUMMER-22 EXAMINATION
Model Answer

Subject title: Chemical Process Instrumentation & Control

Subject code

22407

Working: Radiation of all possible wave lengths from a hot body is focused by the lens on the radiation receiving element. When thermopile or vacuum thermocouple is used as radiation receiving element, the radiant energy from the target is focused on the blackened measuring junction. Due to absorption of radiant energy, the measuring junction temperature rises. According to Seebeck effect, emf is developed between output leads which are proportional to temperature difference between measuring and reference junction. The emf developed is calibrated in terms of target temperature by using either a voltmeter or Wheatstone bridge circuit.

Page 21 of 21

	<p>It consists of a nozzle flapper assembly and a relay. The nozzle back pressure is controlled by the nozzle flapper distance. A feedback bellows and spring is added to the bottom of the flapper. A variable restriction known as derivative restriction is introduced in to the line leading to the feedback bellows. Reset bellows and an adjustable restriction known as integral restriction calibrated in time units provide reset or integral control action.</p> <p>Working:</p> <p>As the input error increases, baffle is moved towards the nozzle increasing the control output through the relay. This change in output pressure is applied to the bellows further closing the nozzle and increasing the output to the maximum. The nozzle back pressure is controlled by the nozzle flapper distance. A derivative restriction is introduced into the line leading to the feedback bellows. Reset or integral action increases the gain of the controller. Greater the restriction imposed upon the flow of air to the feedback bellows, greater will be the pressure drop across the restriction and greater will be the increase of pressure due to derivative action. The rate at which integral action is applied depends on the rate at which air flows through the integral restriction. By causing both positive and negative feedback to lag the output pressure, both rate and reset action may be obtained which is known as PID control action.</p>	<p>2</p> <p>2</p>
