

**SUMMER -2017 EXAMINATION**

**Model Answer**

**Page No: 01/26**

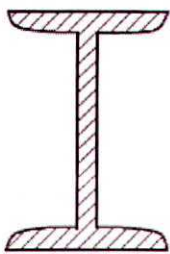

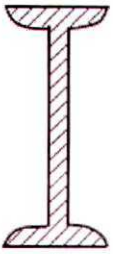

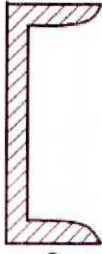

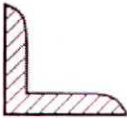

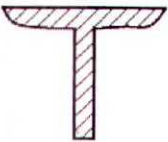

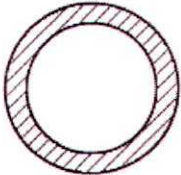

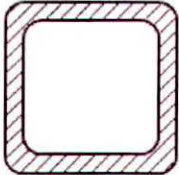

**Subject code: 17505 Subject : ( Design of Steel Structure)**

**Important Instructions to examiners:**

- 1) The answer should be examined by keywords and not as word-to- word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language error such as grammatical, spelling errors should not be given more importance. (Not applicable for subject English and communication skill).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figure drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In the some cases, the assumed constants values may vary and there may be some difference in the candidates answer and model answer.
- 6) In case of some questions credit may be given by judgment on part of examiner of relevant answer based on candidates understanding

Que.	Model Answer	Marks
<b>Q. 1 (A)</b>	<b>Attempt any Three</b>	<b>12 M</b>
<b>a)</b>	<b>State six advantages and two disadvantages of steel as a construction material</b>	
	<b>Advantages of Steel as a construction material:-</b> i) Mechanical Properties :-Steel as a good mechanical properties such as ductile ,malleability, Elastic Plasticity ii) Large span :-Steel is very useful for large span bridges ,Industrial structures .towers iii) Fabrication:- Steel is easy to fabricate at desired shape and size ,It can be easily joined iv) Earthquake Resistance :- Steel as construction material has good earthquake resistant capacity due to its ductility and elastic Plasticity v) Force Resistance:-Steel can be easily resistance tensile, Compressive , shear bending , torsional forces vi) Scrap Value:-Steel scrap value is considerable vii) Reuse :- Steel as construction material can be recycled easily . viii) Gas Resistance :- Steel is a gas resistance	<b>3 M Any six (½ M each)</b>

	<p><b>Disadvantages of Steel as a construction material:-</b></p> <p>i) Cost:- Steel is very costly material</p> <p>ii) Corrosion:- Steel is susceptible to corrosion and it requires maintenance.</p> <p>iii) Skilled labours For construction of steel structure it required skilled labor</p> <p>iv) Maintenance:- The cost of the Maintenance of steel structure is comparatively high</p>	<p><b>1M</b>  <b>Any two</b>  <b>( ½ M</b>  <b>for</b>  <b>each)</b></p>
<b>b)</b>	<b>Explain the limit states of serviceability applicable to steel structure</b>	
	<p><b>Limit states of serviceability applicable to steel structure-</b></p> <p>The acceptable limit for the safety and serviceability of the structure before failure occur is called as Limit State. To assure the serviceability of structure throughout its lifetime. It is related to the satisfactory performance of the structure at working load .</p> <p>The following limit state of serviceability is considered.</p> <p>i) Deflection and deformation Which may adversely affect the effective use of the structure or may cause improper functioning of equipment or services or may cause damages to finishes and non structural members</p> <p>ii) Corrosion durability</p> <p>iii) Repairable damage or crack due to the fatigue</p> <p>iv) Fire</p>	<p><b>1 M</b></p> <p><b>3 M</b></p>
<b>c)</b>	<b>State types of loads to be considered while designing of steel structure And with respective IS codes</b>	
	<p><b>Types of loads to be considered while designing of steel structure And with respective IS codes</b></p> <p><b>i) Dead Load – ( IS 875 : 1987Part I)</b>  It include the weight of all permanent construction for extra weight of roof floors column, beams, finishing, material etc unit wt of building material</p> <p><b>ii) Imposed load or live load – ( IS 875 : 1987Part II)</b>  The loads which keeps on changing from time to time are collect as live load</p> <p><b>iii) Snow Load – ( IS 875 : 1984 Part IV)</b>  Specifies the snow loads on roofs of building .It is considered for the area where snowfall is possible.</p> <p><b>iv) Impact load – ( IS 875 : 1987Part V)</b>  Gives specification for impact load due to a) Vehicle</p>	<p><b>Any 4</b>  <b>( one</b>  <b>mark</b>  <b>for</b>  <b>each)</b></p>

	<p>b) Dropped object      c) Crane failure      d) Flying fragment</p> <p><b>v) Seismic Forces – ( IS 1893 :2002)</b>          Earthquake shocks cause movement of foundation and due to inertia forces; additional loads are developed on the structure. The vibration caused by earthquake is resolved into three mutually perpendicular directions. The behavior of the structure is the function of foundation, soil size, duration, shape of construction and Intensity of Earthquake forces.</p>	
<p><b>d)</b></p>	<p><b>Enlist four types of section used as tension member along with sketches</b></p>	
	<p><b>Types of section used as tension member with sketch</b></p> <div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;">  <p><b>W</b> (a) Wide-flange Shape</p> </div> <div style="text-align: center;">  <p><b>S</b> (b) American standard beam</p> </div> <div style="text-align: center;">  <p><b>C</b> (c) American standard channel</p> </div> <div style="text-align: center;">  <p><b>L</b> (d) Angle</p> </div> <div style="text-align: center;">  <p><b>WT or ST</b> (e) Structural tee</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;">  <p>(f) Pipe Section</p> </div> <div style="text-align: center;">  <p>(g) Structural tubing</p> </div> <div style="text-align: center;">  <p>(h) Bars</p> </div> <div style="text-align: center;">  <p>(i) Plates</p> </div> </div> <p>(*Note- if any four sections drawn credit is given to students accordingly)</p>	<p><b>Any 4 (one mark for each)</b></p>
<p><b>B)</b></p>	<p><b>Attempt any ONE</b></p>	<p><b>6M</b></p>
<p>a)</p>	<p><b>Design the lap joint for the plates of sizes 100 x 12 mm and 1100 x 8 mm thick connected, so as to transmit a factored load of 80 kN of 16 mm dia bolts of grade 4.6 and plates of 410 grade</b></p>	

**Given :**

$$t = 8 \text{ mm}$$

$$P_u = 80 \text{ kN}$$

$$d = 16 \text{ mm}$$

$$d_0 = 18 \text{ mm}$$

$$f_{ub} = 400 \text{ N/mm}^2$$

$$f_u = 410 \text{ N/mm}^2$$

Solution :-

i) To calculate nominal shear strength of bolt =

$$V_{nsb} = f_{ub} / \sqrt{3} (n_n A_{nb} + n_s A_{sb})$$

1 M

$$\begin{aligned} A_{nb} &= 0.78 \times A_g \\ &= 0.78 \times \frac{\pi}{4} \times 16^2 \\ &= 156.82 \text{ mm}^2 \end{aligned}$$

$$V_{nsb} = 400 / \sqrt{3} (1 \times 156.82) = \underline{\underline{36.21 \text{ kN}}}$$

1 M

ii) To calculate design of shear strength of bolt :-

$$\begin{aligned} V_{dsb} &= V_{nsb} / 1.25 \\ &= 36.21 / 1.25 \\ &= 28.97 \text{ kN} \end{aligned}$$

1 M

$$\text{Bolt Value } B_v = \underline{\underline{28.97 \text{ kN}}}$$

iii) To calculate no of bolt =  $\frac{\text{Factored Load}}{\text{Bolt Value}}$

$$\begin{aligned} &= \frac{80}{28.97} \\ &= 2.85 = \underline{\underline{3 \text{ Nos}}} \end{aligned}$$

1 M

iv) To calculate Pitch (p)

$$\begin{aligned} T_{dn} &= \frac{0.9 f_u (P - d_0) t}{\gamma_{m_b}} \\ 28.97 \times 1000 &= \frac{0.9 \times 410 (P - 18) \times 8}{1.25} \end{aligned}$$

$$P = 30.267 \text{ mm} \dots$$

$$\text{But } P_{\min} = 2.5 \times d = 2.5 \times 16 = \underline{\underline{40 \text{ mm}}}$$

1 M

v) To calculate nominal bearing strength of bolt:-

$$V_{npb} = 2.5 K_b \cdot d \cdot t \cdot f_u$$

$$e = 1.5 \cdot d_0 = 1.5 \cdot 18 = 27$$

$$K_{b1} = e / 3 d_0 = 0.5$$

$$K_{b2} = (p / 3 d_0) - 0.25 = 0.490$$

$$K_{b3} = f_{ub} / f_u = 0.97$$

$$K_{b4} = 1$$

1 M

Whichever is minimum value of  $K_b = 0.49$

	$V_{npb} = 2.5 K_b * d * t * f_u$ $= 2.5 * .49 * 16 * 8 * 410$ $= \underline{64.28 \text{ kN}}$	1M
	iv) To calculate design bearing strength of bolt $V_{dpb} = V_{npb} / \gamma_{m_0}$ $= 64.28 / 1.25$ $= \underline{57.43 \text{ kN}}$	1M
<b>Q.1 B (b)</b>	<b>The longer leg of a single angle 100 x 75 x 8 mm is connected to the gusset plate with 3 bolts in a line of 20 mm dia at a pitch of 60 mm , for this tension member. Determine block shear strength</b>	
	<b>Given :</b> <b>ISA = 100 x 75 x 8 mm</b> <b>d = 20 mm</b> <b>d<sub>0</sub> = 22 mm</b> <b>P = 60 mm , 3 Bolts in a line of 20 mm dia</b> <b>End distance e = 2d = 2 x 20 = 40 mm</b> Solution :- $L_v = ( 60 + 60 + 40 ) = 160 \text{ mm}$ Assum $L_t = 40 \text{ mm}$ 1 ) $A_{tg} = ( L_t \times t )$ $= 40 \times 8 = 320 \text{ mm}^2$ 2) $A_{tn} = ( L_t - 0.5 d_0 ) \times t$ $= 232 \text{ mm}^2$  2) $A_{vg} = ( L_v \times t )$ $= ( 160 \times 10 ) = 1280 \text{ mm}^2$  3) $A_{vn} = ( L_v - 2.5 d_0 ) \times t$ $= ( 160 - 2.5 \times 22 ) \times 8$ $= 840 \text{ mm}^2$  <b>To calculate Block shear strength</b> $T_{db1} = \frac{A_{vg} \times f_y}{\sqrt{3} \times \gamma_{m_0}} + \frac{0.9 \times A_{tn} \times f_u}{\gamma_{m_1}}$  $\gamma_{m_0} = 1.10$ $\gamma_{m_1} = 1.25$ $f_{ub} = 400 \text{ n/mm}^2$ $f_u = 410 \text{ n/mm}^2$ $T_{db1} = \frac{1280 \times 250}{\sqrt{3} \times 1.10} + \frac{0.9 \times 232 \times 410}{1.25}$ $= 236.43 \text{ kN}$	½ M  ½ M  ½ M  ½ M  2 M

	$T_{db2} = \frac{0.9 A_{vn} \times f_u}{\sqrt{3} \times \gamma_{m1}} + \frac{A_{tg} \times f_y}{\gamma_{m0}}$ $= \frac{0.9 \times 840 \times 410}{\sqrt{3} \times 1.25} + \frac{232 \times 250}{1.10}$ $= \underline{195.88 \text{ kN}}$ <p>Block shear strength of member is 195.88 kN</p>	2 M
<b>Q.2</b>	<b>Attempt any TWO of the following</b>	<b>16 M</b>
a)	A lap joint consists of two plates 180 x 10 mm connected by means of 20 mm dia bolts of grade 4.6 . All bolts are in one line . Calculate strength of single bolt and no. of bolts to be provided.	
	<p><b>Given</b>  t = 10 mm  d = 20 mm  d<sub>0</sub> = 22 mm  f<sub>ub</sub> = 400 N/mm<sup>2</sup>  f<sub>u</sub> = 410 N/mm<sup>2</sup></p> <p>Solution :-</p> <p>i) To calculate nominal shear strength of bolt =</p> $V_{nsb} = f_{ub} / \sqrt{3} (n_n A_{nb} + n_s A_{sb})$ $A_{nb} = 0.78 \times A_g$ $= 0.78 \times \pi / 4 \times 20^2$ $= 245 \text{ mm}^2$ $V_{nsb} = 400 / \sqrt{3} (1 \times 245) = \underline{56.58 \text{ kN}}$ <p>ii) To calculate design of shear strength of bolt :-</p> $V_{dsb} = V_{nsb} / 1.25$ $= 56.58 / 1.25$ $= \underline{45.26 \text{ kN}}$ <p>iii) To calculate nominal bearing strength of bolt:-</p> $V_{npb} = 2.5 K_b \times d \times t \times f_u$ $P = 2.5 \times d = 2.5 \times 20 = 50 \text{ mm}$ $e = 1.5 \times d_0 = 1.5 \times 22 = 33$ $K_{b1} = e / 3 d_0 = 0.5$ $K_{b2} = (p / 3 d_0) - 0.25 = 0.5$ $K_{b3} = f_{ub} / f_u = 0.97$ $K_{b4} = 1$	<p>½ M</p> <p>1 M</p> <p>1 M</p> <p>1 M</p>
	Whichever is minimum value of K b = 0.50	

	$V_{npb} = 2.5 K_b * d * t * f_u$ $= 2.5 * 0.5 * 20 * 10 * 410$ $= \underline{102.50 \text{ kN}}$ <p>iv) To calculate design bearing strength of bolt</p> $V_{dpb} = V_{npb} / \gamma_{m_b}$ $= 102.50 / 1.25$ $= \underline{82 \text{ kN}}$ <p>Bolt Value = Minimum strength of shearing and bearing strength of bolt</p> $B_v = 45.26 \text{ kN}$ <p>To calculate no. of bolt = <math>\frac{\text{Full strength of bolt}}{\text{Bolt Value}}</math></p> <p>Full strength of bolt = <math>(0.9 f_u / \gamma_{m_b}) * \text{Area of plate}</math>  Area of plate = <math>(180 - 22) * 10</math>  <math>= 1580 \text{ mm}^2</math></p> <p>Full strength of bolt = <math>(0.9 * 410 / 1.25) * 1580 = \underline{466.416 \text{ KN}}</math></p> <p>No of Bolt = <math>\frac{466.416}{45.26}</math>  <math>= 10.30</math>  <math>= \underline{11 \text{ Nos}}</math></p>	<p>1 M</p> <p>1 M</p> <p>½ M</p> <p>1 M</p> <p>1 M</p>

c)	<p><b>An ISMB 400 @ 6043 N/m is used as a simply supported beam for 3 m span . The compression flange of beam is laterally through out the span . Determine design flexural strength of member . Also calculate working u.d.l. the beam can carry per m span</b>  <b>Take <math>Z_p = 1176.18 \times 10^3 \text{ mm}^3</math> <math>\gamma_{m_0} = 1.1</math> , <math>\beta_b = 1</math> <math>f_y = 250 \text{ N/mm}^2</math></b></p>	
	<p><b>Given :</b>  <b>ISMB 400 wt 6043 N/m</b>  <b><math>L = 3000 \text{ mm}</math></b>  <b><math>Z_p = 1176.18 \times 10^3 \text{ mm}^3</math></b>  <b><math>\gamma_{m_0} = 1.1</math></b>  <b><math>\beta_b = 1</math></b>  <b><math>f_y = 250 \text{ N/mm}^2</math></b></p>	

Solution :-

Assuming UDL = w kN/m

1) To calculate the design flexural strength Md =

$$M_d = \frac{\beta b \times Z_p \times f_y}{\gamma_{m_0}} = \frac{1 \times 1176.18 \times 10^3}{1.10}$$

$$= \underline{267.27 \times 10^6 \text{ kN-m}}$$

4 M

$$2. M_u = \frac{w l^2}{8}$$

$$= \frac{w \times 3^2}{8} = 1.125 w \text{ kNm}$$

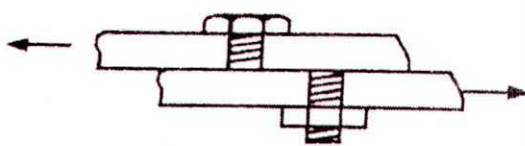

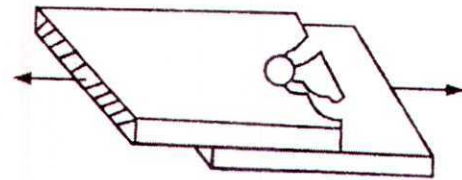

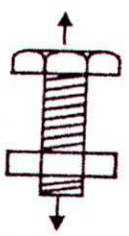

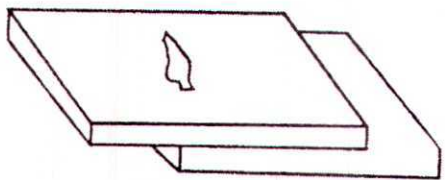

$$M_d = M_u$$

$$267.27 \times 10^6 = 1.125 w$$

$$\underline{w = 237.57 \text{ kN/m}}$$

4M

P.T.O.

Question and sub Question	Model Answer	Marks
<p><b>Q.3</b></p> <p>a) <b>Explain any two types of failure of bolted joint along with drawing of respective sketches.</b></p> <p><b>i) Shear failure – shear failure of bolt or tearing failure of plate.</b></p>	<p>Attempt any <b>FOUR</b></p> <p>Plates bolted together and subjected to tensile load may result in the shearing of bolts. In case of lap joint when the shearing of bolt occurs at one cross section, same is referred as single shear failure. If it occurs at two cross sections, as in case of butt joint with two cover plates, it is called as double shear failure.</p> <p>When the strength of the plate is less than the shearing strength of bolt, the tearing failure of plate may occur. To avoid this type of failure minimum edge distance shall be provided.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p><i>Shear failure of bolt</i></p> </div> <div style="text-align: center;">  <p><i>Shear failure of plate</i></p> </div> </div> <p><b>ii) Tension failure – Tension failure of bolt or tension failure of plate.</b></p> <p>The bolt subjected to tensile force fails if factored tensile force is greater than the tensile capacity of the bolt. The tensile capacity depends upon the tensile strength of the bolt and minimum cross sectional area of the threaded length of the bolt.</p> <p>When the tensile strength of plate is less than tensile force acting on the plate then the plate will fail in tension.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p><i>Tensile failure of bolt</i></p> </div> <div style="text-align: center;">  <p><i>Tensile failure of plate</i></p> </div> </div> <p><b>iii) Bearing Failure – Bearing failure of bolt or bearing failure of plate.</b></p> <p>Normally the bolt material is of much higher strength than that of steel plate through which the bolt passes. As a result bearing failure takes place in the plate material. The bolt may deform due to high local bearing stresses between the bolt and the plate.</p>	<p><b>16 Marks</b></p> <p>Any Two. (Two marks each)</p> <p>1 Mark</p> <p>1 Mark</p> <p>1 Mark</p> <p>1 Mark</p> <p>1 Mark</p>

*Bearing failure of bolt*

*Bearing failure of plate*

1 Mark

b) **State two advantages of welded joints and two disadvantages of bolted joints.**

**Advantages of welded Joints-**

- i) As no holes are required for welding, the gross sectional area of member is effective, hence more effective in taking loads.
- ii) Welded joints provides rigidity and strength
- iii) Welded structures are comparatively lighter than same type of bolted structures.
- iv) A welded joint has a better finish and appearance.
- v) No noise is produced in welding process as in case of bolting process.
- vi) Welded joints are often economical as less labour and material are required for a joint.
- vii) The welding process offers an airtight and water tight joint hence used in fluid retaining structures.
- viii) Welding process is quick and saves time of construction and requires less working space.

Any Two for Two marks

**Disadvantages of bolted joints-**

- i) In bolted joints holes are required in the members hence reduces gross cross sectional area of member.
- ii) Lot of noise is produced in bolting process.
- iii) Skilled labour and material required is more as compared to welded joints.
- iv) Bolted connection is not useful in fluid retaining structures.
- v) The overall weight of structures is increased due to weight of bolts.

Any Two for Two marks

c) **Draw neat sketch of PRATT and FINK type trusses. Mark panel, panel point, rafter and tie in any one truss.**

( Used up to Spans 6m to 30m )

**Pratt truss**

2 Mark

2 Marks

( Used up to Spans 6m to 9m )

**Fink truss**

OR

( Used up to Spans 6m to 20m )

**Compound fink truss**

- d) Draw neat sketches connection of an angle purlin with principal rafter at panel point.

- e) Write any four selection criteria of type of roof truss.

1. Climatic condition -: Rainfall, snowfall, drainage required (Affects pitch of roof)
2. Type of roof covering-: Galvanised iron or asbestos cement sheeting. It affects pitch of truss.
3. Span-: As per required span, the selection of type of truss depends.
4. Asthetic view-: from asthetic point of view the truss is to be selected.
5. Transportation-: Feasibility of transportation of truss depends upon the depth and span of the truss.
6. Purpose of the structure-: depending upon purpose and utility of structure type of truss is selected.

OR

2 Marks

Any four  
for Four  
marks.

Q.4 (A) Attempt any **THREE**

i) **Draw and Label any four form of built up compression member.**

12Marks

i) Two angles back to back

ii) I section with two plates on flanges

iii) Two channels placed toe to toe      iv) Four angles placed toe to toe with two plate  
if any other four built up sections drawn credit is given to students accordingly

Any four for one mark each.

ii) **Define radius of gyration and slenderness ratio. Also state maximum values of slenderness ratio for any two condition of compression member.**

**Answer-**

**Radius of Gyration (K)**-The radius of gyration of a given area about a given axis is that distance from the given axis at which all elemental areas of given area should have to be placed so as not alter the moment of inertia about given axis. OR

It is the square root of ratio of moment of inertia to the cross sectional area.

1 Mark

**Slenderness Ratio ( $\lambda$ )** - It is the ratio of effective length of column to its least radius of gyration.

$$\lambda = L_{eff}/r_{min}$$

1 Mark

**Maximum values of slenderness ratios.**

Type of member	Maximum slenderness Ratio
i) A member carrying compressive load resulting from dead loads and imposed loads	180
ii) A member subjected to compressive forces resulting from wind or earthquake forces.	250

2 Mark

iii) **State the functions of lacing and battening. Draw neat sketches of single lacing and battening.**

**Answer-**

**Function of lacing and battening** -Function of lacing and battening is to hold the main components of the members of built up section in their respective positions and equalize the stresses in them.

1 Mark

i) Single lacing System

ii) Battening system

iv) State IS requirements of lacing to be used.

Answer-

IS requirements of Lacing-

- Radius of gyration about axis of cross section perpendicular to plane of lacing should not be less than radius of gyration about the axis parallel to plane of lacing.
- Lacing system shall be uniform throughout the length of column i.e. inclination of lacing flat with axis of column should be equal on its either side. Cross section should be uniform for all lacing flats.
- Lacing system should not be combined with tie plates except at the end of column.
- Effective slenderness ratio of laced column shall be taken as 1.05 times actual maximum slenderness ratio in order to account for shear deformation.
- Width of lacing flat shall be three times nominal diameter of bolt/rievet. This is to provide edge distance =  $1.5d$  from the centre of bolt.
- Thickness of lacing flat shall not be less than  $1/40$  times effective length for single lacing system and  $1/60$  times for double lacing system.
- Angle of inclination for lacing bar with axis of column must not be less than  $40^\circ$  nor it should be more than  $70^\circ$ .
- Maximum slenderness ratio of single main member over two consecutive connections of lacing flat should not be greater than 50 or 0.7 times the maximum slenderness ratio of member as a whole, whichever is less.
- Lacing flats to be designed for transverse shear  $V_t = 2.5\%$  of axial force in member and it shall be divided equally among all lacing parallel planes.
- Slenderness ratio of lacing flat shall not exceed 145. Effective length in case of single lacing is length measured between inner ends of weld or rivet/bolt.

Question

Description

Marks

Q.4(B) Answer —

ii) Given -  $P_u = 200 \text{ kN}$ , Bolt dia ( $d$ ) = 20mmDesign strength of bolt = 45.3 kN,  $f_y = 250 \text{ N/mm}^2$  $f_u = 410 \text{ N/mm}^2$ ,  $\alpha = 0.8$ 

Step 1 - Approximate Gross c/s Area required

$$A_{g \text{ reqd.}} = \frac{T}{f_y} \times \gamma_{m0}$$

$$= \frac{200 \times 10^3}{250} \times 1.1$$

$$A_g = 880 \text{ mm}^2$$

Step 2 - select ISA 100 x 75 x 6mm having

$$A_g = 1014 \text{ mm}^2$$

Step 3 - No. of bolts reqd. =  $\frac{\text{Factored load}}{\text{Design strength of Bolt}} = \frac{200}{45.3}$ 

$$= 4.41 \approx 05$$

Provide 5 bolts of 20mm dia.

Step 4 - Check for Design strength

i) Design tensile strength governed by gross section yielding

$$T_{dg} = \frac{A_g \cdot f_y}{\gamma_{m0}} = \frac{1014 \times 250}{1.1}$$

$$T_{dg} = \underline{\underline{230.45 \text{ kN}}}$$

ii) Design tensile strength governed by Net section rupture

$$T_{dn} = \frac{0.9 f_u A_n}{\gamma_{m1}}$$

Net Area of Connected leg.

$$A_{nc} = \left[ 100 - 22 - \frac{6}{2} \right] \times 6 = 450 \text{ mm}^2$$

Net Area of Outstanding leg

$$A_{no} = \left[ 75 - \frac{6}{2} \right] \times 6 = 432 \text{ mm}^2$$

$$\text{Net Area } A_n = A_{nc} + A_{no} = 450 + 432 = 882 \text{ mm}^2$$

1 Mark

1 Mark

Question

Description

Marks

$$T_{dn} = \frac{0.9 f_u A_n}{\gamma_{m1}} = \frac{0.9 \times 410 \times 882}{1.25}$$

$$T_{dn} = \underline{260.36 \text{ kN}}$$

iii) Design tensile strength Governed by block shears

$$P = 2.5d = 2.5 \times 20 = 50 \text{ mm}$$

$$e = 1.7d_o = 1.7 \times 22 = 37.4 \leq 40 \text{ mm}$$

If  $P$  &  $e$  ~~and~~ considered different marks given Accordingly,

$$A_{vg} = [4 \times 50 + 40] \times 6 = 1440 \text{ mm}^2 \text{ given Accordingly}$$

$$A_{gn} = [4 \times 50 + 40 - 4.5 \times 22] \times 6 = 846 \text{ mm}^2$$

$$A_{tg} = 50 \times 6 = 300 \text{ mm}^2$$

$$A_{tn} = [50 - 0.5 \times 22] \times 6 = 234 \text{ mm}^2$$

$$\begin{aligned} T_{db1} &= \frac{A_{vg} \cdot f_y}{\sqrt{3} \gamma_{m0}} + \frac{0.9 A_{tn} \cdot f_u}{\gamma_{m1}} \\ &= \frac{1440 \times 250}{\sqrt{3} \times 1.1} + \frac{0.9 \times 234 \times 410}{1.25} \\ &= 188.97 + 69.07 = \underline{258.04 \text{ kN}} \end{aligned}$$

$$\begin{aligned} T_{db2} &= \frac{A_{tg} \cdot f_y}{\gamma_{m0}} + \frac{0.9 A_{gn} \cdot f_u}{\sqrt{3} \gamma_{m1}} \\ &= \frac{300 \times 250}{1.1} + \frac{0.9 \times 846 \times 410}{\sqrt{3} \times 1.25} \\ &= 68.18 + 144.19 = \underline{212.37 \text{ kN}} \end{aligned}$$

$T_{db} = \text{minimum of } T_{db1} \text{ \& } T_{db2}$

The design tensile strength of the angle

= least of  $T_{dg}$ ,  $T_{dn}$ ,  $T_{db}$

$$= 212.37 \text{ kN} > 200 \text{ kN}$$

Hence Design is safe.

Q.5 a) Design of slab base.

Given

Column = ISHB 350 @ 710.2 @ N/m  $t_f = 11.6 \text{ mm}$   $b_f = 250 \text{ mm}$

Factored Load =  $P_u = 1500 \text{ kN}$

Grade of Concrete = M20

$f_y = 250 \text{ MPa}$   $f_u = 410 \text{ MPa}$   $\gamma_{mo} = 1.1$

Soln → 1) Calculation for Base Plate Area ( $L_p$  &  $B_p$ )

Required Area of Base Plate =  $A_b = \frac{\text{Factored Load}}{\text{Bearing strength of concrete}}$  (1M)

$$A_b = \frac{1500 \times 10^3}{0.6 \times 20} = 125000 \text{ mm}^2$$

For equal projections ( $a = b$ )

$$\text{Length of base plate } (L_p) = \left( \frac{350 - 250}{2} \right) + \sqrt{\left( \frac{350 - 250}{2} \right)^2 + 125000} \text{ (1M)}$$

$$L_p = 407.07 \text{ mm}$$

$$\underline{L_p \approx 408 \text{ mm}}$$

$$\therefore \text{Width of base plate } (B_p) = \frac{A_b}{408} = \frac{125000}{408} \text{ (1M)}$$

$$\therefore B_p = 306.37 \text{ mm}$$

$$\therefore \underline{B_p \approx 308 \text{ mm}}$$

Hence provide Base Plate (408 mm x 308 mm) (1M)

2) Calculation of thickness of base plate ( $t_s$ )

longer Projection =  $a = \frac{408 - 350}{2} = 29 \text{ mm}$

& smaller Projection =  $b = \frac{308 - 250}{2} = 29 \text{ mm}$

(1M)

∴ Net upward pressure on base-plate

$$w = \frac{1500 \times 10^3}{(408 \times 308)}$$

$$w = 11.94 \text{ N/mm}^2$$

(1M)

Thickness of base Plate

$$t_s = \sqrt{\frac{2.5w(a^2 - 0.3b^2)}{f_y/1.1}}$$

$$t_s = \sqrt{\frac{2.5 \times 11.94 \times (29^2 - 0.3(29)^2)}{250/1.1}}$$

(1M)

$$\therefore t_s = 8.79 \text{ mm}$$

Thickness must be more than  $t_f = 11.6 \text{ mm}$

∴ Provide thickness of plate is 12 mm

Provide size of bearing or Base Plate

$$\underline{(408 \text{ mm} \times 308 \text{ mm} \times 12 \text{ mm})}$$

(1M)

## Q.5 b) Load Analysis of DL &amp; LL of Roof Truss

Given:-

Pitch Roof Truss Span = 12 m

GI sheet covering weight = 160 N/m<sup>2</sup>Weight of Purlin = 60 N/m<sup>2</sup>self wt. of Truss = 100 N/m<sup>2</sup>

No. of Pannels = 8

Pitch of roof = 1/6

\* Assume spacing between roof Trusses = 4 m

$$\text{soln} \rightarrow \text{slope of Roof} = \theta = \tan^{-1} \left( \frac{\text{pitch}}{2} \right) = \tan^{-1} \left( 2 \times \frac{1}{6} \right)$$

$$\therefore \theta = 18.44^\circ$$

$$\text{Pannel point Plan Area} = \left( \frac{12 \times 4}{8} \right) = 6 \text{ m}^2$$

(1M)

1) Dead load calculation

Total Dead load coming on plan area of truss

$$= 160 + 60 + 100 = 320 \text{ N/m}^2$$

(1M)

DL on each interior panel point = 320 × 6

$$= 1920 \text{ N} = \boxed{1.92 \text{ kN}(\downarrow)}$$

(1M)

DL on each end panel point =  $\frac{1.92}{2} = \boxed{0.96 \text{ kN}(\downarrow)}$  (1M)2) Live Load calculation

LL on Purlins = 750 - (18.44 - 10) 20

$$= 581.2 \text{ N/mm}^2 > \text{min } 400 \text{ N/mm}^2$$

(1M)

LL on Truss =  $\frac{2}{3} (581.2)$ 

$$= 387.47 \text{ N/mm}^2$$

(1M)

LL on each interior Pannel = (387.47 × 6)

$$\text{(on plan Area of Truss)} = 2324.82 \text{ N} = \boxed{2.32 \text{ kN}(\downarrow)}$$

(1M)

$$LL \text{ on each end Panel} = \frac{2.32}{2} = \boxed{1.16 \text{ kN}}$$

(1M)

DL &amp; LL on Pratt roof Truss

$$\text{For DL (F)} = 1.92 \text{ kN} \quad \& \quad \text{For LL (F)} = 2.32 \text{ kN}$$

(\* Appropriate Assumption of spacing both truss will change Answers)

Q.5C) LL & WL calculation for roof Truss

Given:- Span of roof truss = 16m

Spacing betn the Trusses = 4m

Rise of truss = 3.5m

No. of panels = 12

Sol<sup>n</sup> → Slope of roof truss  $\theta = \tan^{-1} \left( \frac{3.5}{16/2} \right) = 23.63^\circ$  (1M)

$$\text{Panel point Plan Area} = \left( \frac{16 \times 4}{12} \right) = 5.33 \text{ m}^2$$

$$\text{Panel point Actual Area} = \left( \frac{5.33}{\cos 23.63^\circ} \right) = 5.82 \text{ m}^2$$

(1M)

Live load (LL) Calculations

$$LL \text{ on purlin} = 750 - [(23.63 - 10) 20] = 477.4 \text{ N/mm}^2$$

(1M)

> 400 N/mm<sup>2</sup>  
minimum.

$$LL \text{ on Truss} = \frac{2}{3} (477.4) = 318.27 \text{ N/mm}^2$$

LL is coming on plan area.

$$\therefore LL \text{ on interior pannel point} = 318.27 \times 5.33 = 1696.36 \text{ N} \approx \boxed{1.7 \text{ kN}}$$

(1M)

$$\therefore LL \text{ on end pannel point} = \frac{1.7}{2} = \boxed{0.85 \text{ kN}}$$

(1M)

$$\underline{LL (F) = 1.7 \text{ kN on panel point}}$$

### 2) Wind Load Calculations :-

Given design wind pressure =  $P_d = 1.2 \text{ kPa} = 1.2 \text{ kN/m}^2$

Coefficient of external wind action =  $-0.7$

Coefficient of internal wind action =  $\pm 0.2$

Max wind pressure distribution on Truss

$$C_{pe} - C_{pi} = -0.7 - (+0.2) = -0.9 \quad \left. \begin{array}{l} \text{select max} \\ \text{OR} \end{array} \right\} -0.9$$

$$= -0.7 - (-0.2) = -0.5$$

(-ve sign indicates uplift.)

WL on intermediate panel point (on actual area)

$$F = [C_{pe} - C_{pi}] P_d \cdot A = -0.9 \times 1.2 \times 5.82$$

$$\therefore F = \boxed{-6.285 \text{ kN}} \text{ (uplift.)}$$

$$\text{W.L. on end panel point} = \frac{F}{2} = \boxed{-3.143 \text{ kN}} \text{ (uplift.)}$$

$$\underline{WL (F) = 6.285 \text{ kN on panel point}}$$

Q.6 Attempt Any FOUR.

Q.6a) Check for shear

Soln → Given ISMB 250  $h = 250 \text{ mm}$   $t_w = 6.4 \text{ mm}$ .

Assuming UDL carried by beam with self wt = 20 kN/m

factored Shear force developed max. at support equal to support reactions.

$$\therefore V_u = \frac{1.5(w \times l)}{2} \quad (1 \text{ M})$$

$$\therefore V_u = \frac{1.5 \times 20 \times 3}{2}$$

$$\therefore V_u = 45 \text{ kN.} \quad (1 \text{ M})$$

Design shear capacity resisted by web of given beam section,

$$V_d = \frac{f_y \times h \times t_w}{\gamma_{m0} \times \sqrt{3}} \quad (1 \text{ M})$$

$$\therefore V_d = \frac{250 \times 250 \times 6.4}{1.1 \times \sqrt{3}}$$

$$\therefore V_d = 209.95 \times 10^3 \text{ N}$$

$$\therefore V_d = 209.95 \text{ kN} \not\leq V_u \quad (1 \text{ M})$$

$\therefore$  Design shear capacity is very large than factored max. shear developed hence beam is safe in shear.

Q.6b) Differentiate between laterally supported & laterally unsupported beam.

Soln → Any four as below.

Laterally Supported Beam

Laterally Unsupported Beam.

① Lateral Deflection of compression flange is totally avoided

① Torsional buckling of beam before failure may occur.

4M

② Compression flange of beam is supported i.e. embedded in concrete etc.

② Compression flange of beam is not supported.

{(1M)}  
for every point

③ Beam is restrain against rotation & takes more load avoiding premature failure

③ Beam is not restrain against rotation & take less load with premature failure may occur.

④ Lateral deflection of compression flange is not possible

④ Lateral deflection of compression flange may be occur.

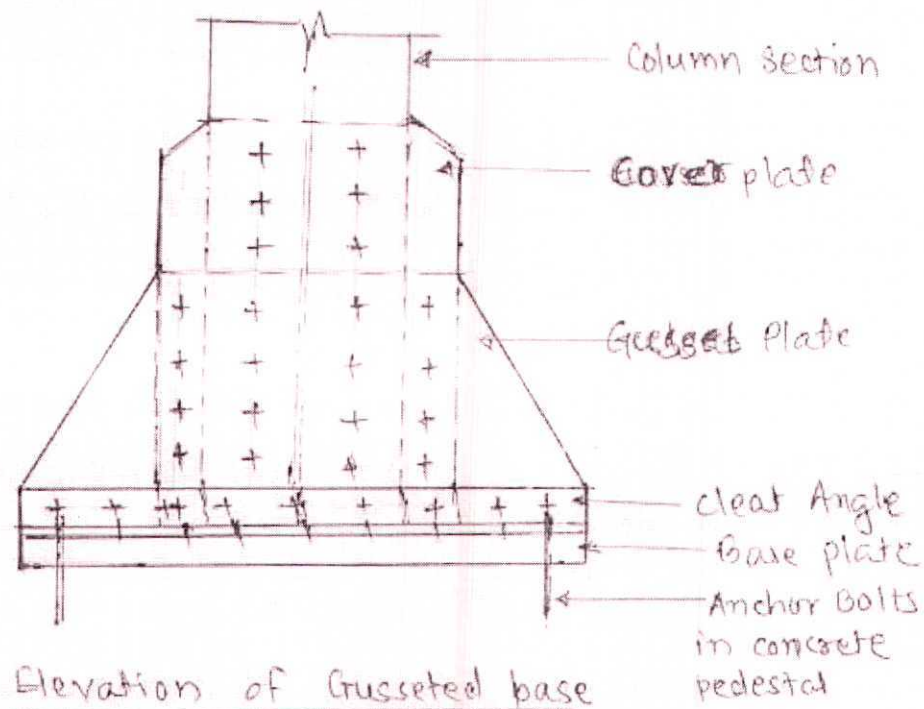

Q.6 c) Sketch of Gussseted Base

(2M)

Plan of Gussseted Base

(2M)

### Q.6 d) Necessity of Column Base

As steel columns carrying heavy loads on small cross sectional area which creates cutting edge or punching effect. To spread loads on large area within permissible limit / bearing limit of below material i.e concrete or soil column base is used.

(2M)

### Function of cleat Angle

To fix the position of gusset plate or column section to base plate or bearing plate cleat angles are used.

(1M)

### Function of Anchor bolt in slab base

To fix the position of base plate / bearing plate with concrete pedestal and some times to take tensile stresses or uplift of base plate anchor bolt is used.

(1M)

Q.6e) Four classification of cross sections of beam on moment-rotation behaviour as per IS 800-2007.

Sol<sup>n</sup>

1) Plastic or Class-I : Develops plastic hinges with large rotation capacity ( $\theta_p$ ), unaffected by local buckling at failure

$$(M \geq M_p \text{ \& } \theta \geq \theta_p)$$

(1M)

2) Compact or Class-II : Develops full plastic moment ( $M_p$ ) but fails by local buckling due to inadequate rotation capacity ( $\theta_p$ )

$$(M = M_p \text{ bu } \theta < \theta_p)$$

(1M)

3) Semicompact or Class-III : Extreme fibers reached the yield stress but local buckling prevents further moment. ( $M = M_y$ )

(1M)

4) Slender or class IV : Premature local buckling prevents yield moment also (i.e.  $M < M_y$ )

(1M)

END.
