

Q.1	(A)b)	<p><b>Explain any two modes of failure of bolted joints along with drawing of respective.</b></p> <p><b>Ans</b></p> <p><b>Two types of failure of bolted joints:-</b></p> <p><b>1. Shear failure of bolt:</b> shear stress are generated when the plates slip due to applied forces. The maximum factored shear force in the bolt may exceed the nominal shear capacity of the bolt. The shear failure of the bolt takes place at the bolt shear plane (interface).the bolt may fail in single or double shear.</p>  <p style="text-align: center;"><b>Shearing at bolt shank</b></p> <p><b>Bearing failure of bolt:-</b>the bolt is crushed around half circumferences. The plate may be strong in bearing and the heaviest stressed plate may press the bolt shank. The bearing failure of bolt generally does not occur in practice.</p>  <p style="text-align: center;"><b>Bearing on bolt</b></p> <p><b>3. Bearing failure of plate:</b> - when an ordinary bolt is subjected to shear forces. The slip takes place and bolt comes in contact with the plate .the plate may get crushed .if the plate material is weaker than the bolt material. The bearing problem can be complicated by the presence of a nearby bolt or the proximity of an edge in the direction of load.</p>  <p style="text-align: center;"><b>Bearing on plate                      Shear tear out of plate</b></p> <p><b>5. Tension or tearing failure of plates:</b> tearing failure occurs when the bolts are stronger than the plate's .tension on both the gross area (yielding) and net effective area (rupture) must be considered.</p>  <p style="text-align: center;"><b>Tension or tearing failure of plates</b></p> <p><b>6. Block shear failure :-</b>Bolts may have been placed at a lesser end distance than required causing the plates to shear out which, however can be checked by observing the specification for end distance .the failure of connection in block may occur when a block of material within the bolted area breaks away from the remainder bolts are used ,fewer bolts will be used for making connection .this type of failure occurs with the shear on one plane and tension on perpendicular plane leading to fall of hatched portion of the plate.</p>	4 m  01 mark for each (any four)

Q 2		<b>Attempt any TWO</b>	<b>16 M</b>
Q 2	(a)	<b>12 mm thick plates are connected using double bolted lap joint using 16mm diameter bolt of 4.6 grade at a pitch of 80 mm. Calculate strength and efficiency of joint.</b>	<b>8 m</b>
	Ans	<p><math>d=16</math> hence, <math>d_0= 16 + 2 = 18\text{mm}</math></p> <p>1) Shear strength of bolt <math>V_{dsb} = f_{ub}/\sqrt{3} \times (n_n \times A_{nb})/\gamma_{mb}</math> <math>=400/\sqrt{3} \times (1 \times 156.82)/1.25</math>      (<math>A_{nb} = 0.78 \times \Pi/4 \times 16^2</math> <math>= 156.82 \text{ mm}^2</math>)</p> <p><math>V_{dsb} = 28.97 \times 10^3 \text{ N}</math> <b><math>V_{dsb} = 28.97 \text{ KN}</math></b></p> <p>2) Bearing strength of bolt Assume <math>e = 40\text{mm}</math> <math>P = 80\text{mm}</math> ( given ) <math>V_{dpb} = 2.5 K_b \cdot d \cdot t_p \cdot F_u / \gamma_{mb}</math> <math>K_b</math> is smaller of i) <math>e/3d_0 = 40/3 \times 18 = 0.74</math> ii) <math>p/3d_0 - 0.25 = 1.23</math> iii) <math>f_{ub}/f_u = 400/410 = 0.98</math> iv) 1 Hence, <b><math>K_b = 0.74</math></b></p> <p>Therefore, <math>V_{dpb} = (2.5 \times 0.74 \times 16 \times 12 \times 410) / 1.25</math> <math>= 116.50 \times 10^3</math> <b><math>V_{dpb} = 116.50 \text{ KN}</math></b></p> <p>Therefore, Strength of bolt = Minimum of shear strength and bearing strength. Therefore, <b>Strength of bolt = 28.97 KN</b></p> <p>As no. of bolts covered in one pitch length are two, the strength of bolted joints/pitch length= <math>= 2 \times \text{strength of bolt}</math> <math>= 2 \times 28.97</math> <math>= 57.94 \text{ KN}</math></p> <p>3) Efficiency of Joint Efficiency = minimum actual strength of joint / Gross strength of solid plate Therefore, Gross strength of solid plate = <math>(0.9 \times f_u \times \text{cross sectional area}) / \gamma_{mb}</math> <math>= (0.9 \times 410 \times 80 \times 12) / 1.25</math> <math>= 283.39 \times 10^3 \text{ N}</math></p> <p>Therefore, Efficiency = <math>(57.94 / 283.39) \times 100</math> <math>= 20.44 \%</math></p>	

Q 2

(b)

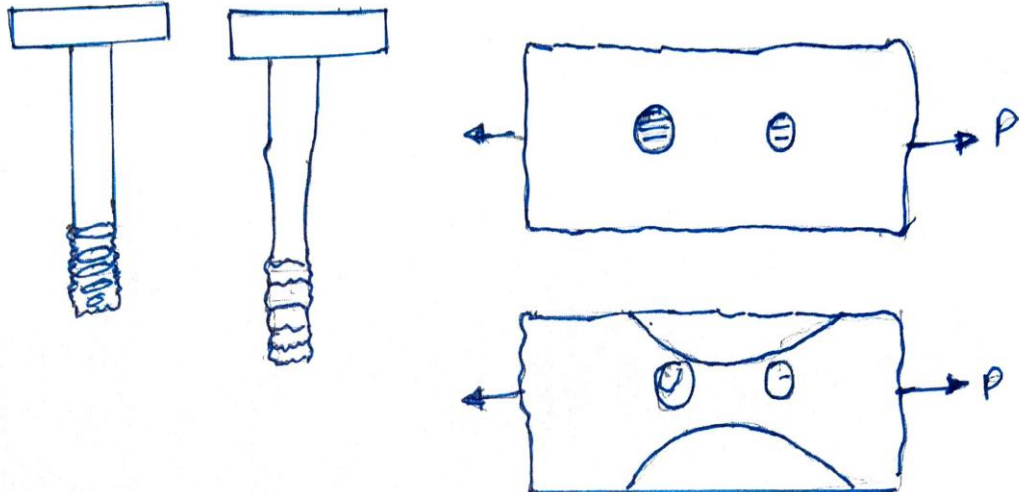

Draw sketches of three different modes of failure in case of members subjected to axial tension.

8 m

Ans

2  
b)

i) Due to yielding of the gross section

ii) Net section rupture

iii) Block shear failure

Q 2

(c)

A strut 2.4 m long of a roof truss consist of a single angle 90 X 90 X 6 mm. Calculate load carrying capacity if it is connected to 8 mm thick gusset plate by welding. Assume properties of ISA 90 X 90 X 6 mm,  $f_y = 250 \text{ N/mm}^2$ , Area =  $1047 \text{ mm}^2$ ,  $C_{xx} = C_{yy} = 2.42 \text{ mm}$ ,  $r_{xx} = r_{yy} = 27.7 \text{ mm}$ ,  $r_{yy} = 17.5 \text{ mm}$ .

8 m

KL/V	80	90	100	110	120	130
$f_{cd} \text{ (N/mm}^2\text{)}$	136	121	107	94.6	83.7	74.4

Ans

Given, ISA 90 X 90 X 6

$$f_y = 250 \text{ N/mm}^2, A = 1047 \text{ mm}^2$$

$$C_{xx} = C_{yy} = 2.42 \text{ mm}$$

$$r_{xx} = r_{yy} = 27.7 \text{ mm}$$

$$r_{yy} = 17.5 \text{ mm}$$

$$r_{\min} = 17.5 \text{ mm}$$

Therefore, S.R =  $KL / r_{\min}$

$$= (0.85 \times 2400) / 17.5$$

$$\text{S.R} = 116.57$$

S.R	$f_{cd}$
110	94.6
116.57	?
120	83.7

$$f_{cd} = 94.6 - (94.6 - 83.7) / (120 - 110)$$

$$= 87.43$$

Therefore,

$$\text{Load carrying capacity } (P_d) = f_{cd} \times A_g$$

$$= 87.43 \times 1047$$

$$= 91.54 \times 10^3 \text{ N}$$

**Load carrying capacity  $(P_d) = 91.54 \text{ KN}$**

Q 3	Attempt any four.	16
Q.3	(a) State the different types of limit state and describe any one of them.	4 m
	<p>Ans Different types of limit state:-</p> <p><b>1. limit state of strength</b></p> <p><b>2. Limit state of serviceability.</b></p> <p><b>1. Limit state of strength:-</b>the limit state of strength associated with failure under the action of probable and most unfavorable combination of factored loads on the structures using the appropriate partial safety factors which may endanger the safety of life and property. Limit state of strength includes: 1. Loss of equilibrium of the as a whole or any its parts or components. 2. Loss of stability of the structure (including the effect of sway where appropriate and overturning or any parts including support and foundation. 3. Failure by excessive deformation rupture of the structure or any part of its part or component. 4. Fracture due to fatigue. 5. Brittle fracture.</p> <p style="text-align: center;"><b>OR</b></p> <p><b>2. Limit state of serviceability.</b></p> <p>1. It includes deformation and deflection which may adversely affect the appearance or effective use of the structure or may cause improper functioning of equipment or services or may be cause damages to finishes and nonstructural members. 2. Vibrations in the structures or any of its components causing discomfort to people damages to the structure its contents or which may limit its functional effectiveness. 3. Repairable damages or crack due to fatigue. 4. Corrosion, durability. 5. Fire.</p>	<p>1 M</p> <p>3 M</p> <p>OR</p> <p>3 M</p>

Q 6		<b>Attempt any FOUR</b>	<b>16 m</b>
Q.6	a)	<b>State any four advantage and dis advantage of welded connection over bolted connection.</b>	<b>4 M</b>
	Ans	<p><b>A) Advantage of welded connection :-</b></p> <ol style="list-style-type: none"><li>1. Since the process does not involve driving hole gross sectional area is effective, so more load carrying capacity of the member as compared to bolted connection.</li><li>2. Welded structures are lighter than bolted connection.</li><li>3. repair and further new connections can be made easily than bolting.</li><li>3. Members of such shapes that afforded difficulty and bolting (like circular sections) can be more easily welded.</li><li>4. A welded structure has a better finish and appearance than the bolted structures.</li><li>5. Connecting gusset plate, angles can be minimize.</li><li>6. It is possible to weld at any point at any part of the structure. But bolting always require enough clearance.</li><li>7. It is possible to get 100% efficiency.</li><li>8. Welded connections are more water tight.</li></ol> <p><b>B) Disadvantage of welded connection :-</b></p> <ol style="list-style-type: none"><li>1. Welding require skilled labour and supervision.</li><li>2. Internal stress in the weld are likely to set up.</li><li>3. Due to uneven heating and cooling the welded members are likely to get warped.</li><li>4. There is a greater possibility of brittle structure in welding.</li><li>5. Testing of welded joint is difficult. it needs non-destructive testing.</li><li>6. Defects like internal air pockets, incomplete penetration are difficult to detect.</li><li>7. Welded joints are over rigid.</li></ol> <p>The fatigue strength is less as compared to bolted joint.</p>	<b>02 m</b> <b>( any four)</b>  <b>02 m</b> <b>(any four)</b>
Q 6	b)	<b>State general requirements for lacing as per IS-800.</b>	<b>4M</b>
	Ans	<p><b>General requirements for lacing as per IS-800.</b></p> <p>a) Members comprising two main components laced and tied, should where practicable, have a radius of gyration about the axis perpendicular to the plane of lacing not less than the radius of gyration about the axis parallel to the plane of lacing.</p> <p>(b)As far as practicable, the lacing system shall be uniform throughout the length of the</p> <p>c) Except for tie plates double laced systems and single laced systems on opposite sides of the main components shall not be combined with cross members (ties) perpendicular to the longitudinal axis of the strut, unless all forces resulting from deformation of the strut members are calculated and provided for in the design of lacing and its fastenings.</p> <p>d) Single laced systems, on opposite faces of the components being laced together shall preferably be in the same direction so that one is the shadow of the other, instead of being mutually opposed in direction.</p> <p>e) The effective slenderness ratio, <math>(kl/r)_e</math>, of laced columns shall be taken as 1.05 times the <math>(kl/r)_o</math>, the actual maximum slenderness ratio, in order to account for shear deformation effects.</p> <p>f) Width of Lacing Bars In bolted/riveted construction, the minimum width of shall be three times the nominal diameter of the end bolt rivet.</p>	

		<p>g) Thickness of Lacing Bars The thickness of flat lacing bars shall not be less than one-fortieth of its effective length for single lacings and one-sixtieth of the effective length for double lacings.</p> <p>h) Rolled sections or tubes of equivalent strength may be permitted instead of flats, for lacings.</p> <p>i) Angle of Inclination: Lacing bars, whether in double. Or single systems, shall be inclined at an angle not less than <math>40^\circ</math> or more than <math>70^\circ</math> to the axis of the built-up member.</p> <p>j) The maximum spacing of lacing bars, whether connected by bolting, riveting or welding, shall also be such that the maximum slenderness ratio of the components of the main member, between consecutive lacing connections is not greater than 50 or 0.7 times the most unfavorable slenderness ratio of the member as a whole, whichever is less, where <math>a_l</math> is the unsupported length of the individual member Between lacing points, and <math>r</math>, is the minimum radius of gyration of the individual member being laced together.</p> <p>k) Where lacing bars are not lapped to form the connection to the components of the members, they shall be so connected that there is no appreciable interruption in the triangulation of the system.</p> <p>l) The lacing shall be proportioned to resist a total transverse shear, <math>V_t</math>, at any point in the member, equal to at least 2.5 percent of the axial force in the member and shall be divided equally among all transverse lacing systems in parallel planes.</p> <p>m) For members carrying calculated bending stress due to eccentricity of loading, applied end moments and/or lateral loading, the lacing shall be proportioned to resist the actual shear due to bending.</p> <p>n) The slenderness ratio, <math>Kl/r</math>, of the lacing bars shall not exceed 145. In bolted/riveted construction, the effective length of lacing bars for the determination of the design strength shall be taken as the length between the inner end fastener of the bars for single lacing, and as 0.7 of this length for double lacings effectively connected at intersections. In welded construction, the effective lengths shall be taken as 0.7 times the distance between the inner ends of welds connecting the single lacing bars to the members.</p>	
Q 6	c)	<p><b>State four classification of cross section of beam based on moment rotation behaviors as per IS-800-2007.</b></p>	4 m
	Ans	<p><b>A. Class 1 (plastic):</b>-cross section which can develop plastic hinges and have the rotation capacity required for failure of the structure by formation of the plastic mechanism.</p> <p><b>B. Class 2 (Compact):</b>cross section which can plastic moment of resistance but have inadequate plastic hinge rotation capacity for formation of plastic mechanism, due to local buckling.</p> <p><b>C. Class 3 (Semi-Compact):</b> cross section in which the extreme fibre in compression can reach yield stress but cannot develop the plastic moment of resistance due to local buckling.</p> <p><b>D. Class 4 (Slender):</b>- cross section in which the elements buckle locally even before reaching yield stress.</p>	1 M (each)

Q 6	d)	<p>Define gusseted base. Also draw its neat labelled sketch showing details.</p> <p><b>Gusseted Base:-</b>for columns carrying heavy loads gusseted bases are used.In gusseted base, the column is connected to base plate through gussets. The load is transferred to the base partly through bearing and partly through gussets.</p> 	4 m  1 M  3M
