SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Digital Techniques

Subject Code: 17333

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No	Sub Q.N.	Answer	Marking Scheme
1.	(A) (i) Ans.	Attempt any SIX of the following: Define digital system and give its two applications. Definition of digital system: The system which processes or works on the digital signal is known as digital system Applications: 1. Flip flops 2. Counters 3. Register 4. Digital calculators 5. Computers	12 2M <i>Definition 1M</i> <i>Any two applications ^{1/2}M each</i>
	(ii) Ans.	State any four Boolean Laws. Boolean laws: $A + 1 = 1$ $A + 0 = A$ $A \cdot 1 = A$ $A \cdot 0 = 0$ $A + A = A$ $A \cdot A = A$	2M <i>Any four laws ^{1/2} M each</i>

SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Digital Techniques

Subject Code: 17333

Fig: Block diagram of 74181 ALU

The functions of various input, output and control lines are given below:

A and B : 4-bit binary data inputs.

\bar{C}_n : Carry input (active-low)

F : 4-bit binary data output.

\bar{C}_{n+4} : Carry output (active-low)

For subtraction operation, it indicates the sign of the output. Logic 0 indicates positive result and logic 1 indicates negative result expressed in 2's complement form.

$A = B$: Logic 1 on this line indicates $A = B$

G : Carry generate output

P : Carry propagate output

G and P outputs are used when a number of 74181 circuits are used in cascade along with 74182 Look-ahead Carry-generator circuit to make the arithmetic operations faster.

Select input (S): Used to select any operation

Model Control (M): $M = 0$ Arithmetic operations

$M = 1$ Logic operations

SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Digital Techniques

Subject Code: 17333

<p>(e) Ans.</p>	<p>Explain master slave JK flip-flop with neat diagram.</p>  <p>Working of a master slave flip flop –</p> <ol style="list-style-type: none">1. When the clock pulse goes to 1, the slave is isolated; J and K inputs may affect the state of the system. The slave flip-flop is isolated until the CP goes to 0. When the CP goes back to 0, information is passed from the master flip-flop to the slave and output is obtained.2. Firstly the master flip flop is positive level triggered and the slave flip flop is negative level triggered, so the master responds before the slave.3. If J=0 and K=1, the high Q' output of the master goes to the K input of the slave and the clock forces the slave to reset, thus the slave copies the master.4. If J=1 and K=0, the high Q output of the master goes to the J input of the slave and the Negative transition of the clock sets the slave, copying the master.5. If J=1 and K=1, it toggles on the positive transition of the clock and thus the slave toggles on the negative transition of the clock.6. If J=0 and K=0, the flip flop is disabled and Q remains unchanged.	<p>4M</p> <p><i>2M for diagram</i></p> <p><i>2M for explanation</i></p>
<p>(f) Ans.</p>	<p>State any four specifications of DAC.</p> <p>1. Resolution: Resolution is defined as the ratio of change in analog output voltage resulting from a change of 1 LSB at the digital input V_{FS} is defined as the full scale analog output voltage i.e. the analog output voltage when all the digital input with all digits 1.</p>	<p>4M</p>

SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Digital Techniques

Subject Code: 17333

		<p>Resolution = $\frac{V_{FS}}{2^n - 1}$</p> <p>2. Accuracy: Accuracy indicates how close the analog output voltage is to its theoretical value. It indicates the deviation of actual output from the theoretical value. Accuracy depends on the accuracy of the resistors used in the ladder, and the precision of the reference voltage used. Accuracy is always specified in terms of percentage of the full scale output that means maximum output voltage</p> <p>3. Linearity:</p> <ul style="list-style-type: none">• The relation between the digital input and analog output should be linear.• However practically it is not so due to the error in the values of resistors used for the resistive networks. <p>4. Temperature sensitivity:</p> <ul style="list-style-type: none">• The analog output voltage of D to A converter should not change due to changes in temperature.• But practically the output is a function of temperature. It is so because the resistance values and OPAMP parameters change with changes in temperature. <p>5. Settling time:</p> <ul style="list-style-type: none">• The time required to settle the analog output within the final value, after the change in digital input is called as settling time.• The settling time should be as short as possible. <p>6. Long term drift</p> <ul style="list-style-type: none">• Long term drift are mainly due to resistor and semiconductor aging and can affect all the characteristics.• Characteristics mainly affected are linearity, speed etc. <p>7. Supply rejection</p> <ul style="list-style-type: none">• Supply rejection indicates the ability of DAC to maintain scale, linearity and other important characteristics when the supply voltage is varied.• Supply rejection is usually specified as percentage of full scale	<p><i>Any four specifications 1M each</i></p>

MODEL ANSWER

Subject: Digital Techniques

Subject Code: 17333

Applying Thevenins theorem at YY

Similarly for digital input 010 and 100 the equivalent voltages are $VR/2^2$ and $VR/2^1$ respectively. The equivalent resistance is $3R$ in each case. So the simplified circuit of 3bit R-2R ladder DAC is

The analog output voltage for a given digital input is given by

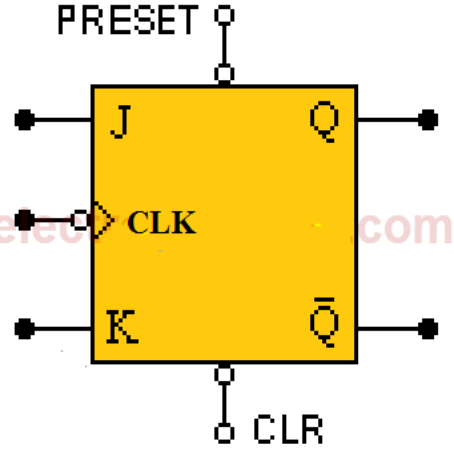

$$\begin{aligned}
 V_{out} &= - \left(\frac{R_f}{3R} \right) V_R \times b_0/2^3 + \frac{R_f}{3R} V_R \times b_1/2^2 + \frac{R_f}{3R} V_R \times b_2/2^1 \\
 &= - \left(\frac{R_f}{3R} \right) \left(\frac{V_R}{2^3} \right) (2^2 b_2 + 2^1 b_1 + 2^0 b_0) \\
 &= - \left(\frac{R_f}{3R} \right) \left(\frac{V_R}{2^3} \right) (4b_2 + 2b_1 + b_0)
 \end{aligned}$$

2M for
diagram

Now from above 4 bit parallel in serial out shift register we can see, A, B, C, and D are the four parallel data input lines and *SHIFT / LOAD* (*SH / LD*) is a control input that allows the four bits of data at A, B, C, and D inputs to enter into the register in parallel or shift the data in serial. When *SHIFT / LOAD* is HIGH, AND gates G1, G3, and G5 are enabled, allowing the data bits to shift right from one stage to the next. When *SHIFT / LOAD* is LOW, AND gates G2, G4, and G6 are enabled, allowing the data bits at the parallel inputs. When a clock pulse is applied, the flip-flops with D = 1 will be set and the flip-flops with D = 0 will be reset, thereby storing all the four bits simultaneously. The OR gates allow either the normal shifting operation or the parallel data-entry operation, depending on which of the AND gates are enabled by the level on the *SHIFT / LOAD* input.

<p>(e)</p>	<p>Design 3-bit asynchronous up counter and describe its operations.</p>	<p>4M</p>
<p>Ans.</p>	<p>The number of states in 3-bit counter is 8 that require 3 flip-flops and QA, QB and QC are the output of the flip-flops. The output QA of the least significant F/F changes for every clock pulse. This can be achieved by using the T-type F/F with TA=1. The output QB makes a transition from 0-1 or 1-0 whenever QA changes from 1 to 0. Therefore if QA is connected to the clock input of next T-type F/F FF1 with TB=1, QB goes from 1-0. Similarly QC makes a transition whenever QB goes from 1-0 and this is achieved by connecting QB to the clock input of the most significant FF2 and TC=1.</p>	<p><i>Operation 1M</i></p>

MODEL ANSWER

Subject: Digital Techniques

Subject Code: 17333

<p>(c) Ans.</p>	<p>(i) Draw neat diagram of RAMP ADC and explain its working.</p> <p>This method of A/D conversion uses a binary counter, to count a continuous train of pulses. The pulses are produced from a clock. They pass through a gate, which is normally closed. It opens only when a start signal is applied to initiate a linear ramp. The gate remains open till the linear ramp voltage reaches a value equal to the input voltage to be measured. The counter thus records a number of clock pulses which is proportional to the input voltage. This method is also called <u>counter method</u>.</p> <p>The fig. shows a schematic diagram of a staircase ramp or counter type A/D converter. This method uses a clock source, a counter and a D/A converter.</p>  <p>(a) Block diagram of a Ramp type ADC</p>  <p>An analog input is applied to one input of an OP AMP which is used as a voltage comparator. A start or convert pulse is applied to the set input of the flip-flop through a monostable multivibrator (i.e. control logic) and also to the reset input of the binary counter. This pulse</p>	<p>4M</p> <p>Diagram 2M</p>
---------------------	---	---------------------------------

SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Digital Techniques

Subject Code: 17333

		<p>resets the binary counter and makes it ready for counting. As the counter resets, output of the D/A converter reduces to zero and thus with positive analog input to the voltage comparator, the output of the comparator goes low, which makes $R = 0$. The start pulse also triggers the monostable multivibrator, which introduces the desired delay in the action of the other circuits. Thus the output of the monostable multivibrator goes high. This makes $S = 1$, while R was already made 0.</p> <p>The RS flip-flop sets and the Y output goes high. The AND gate is enabled & the counter starts the counting the clock pulses. The output of the counter is fed to a D/A converter which produces an analog output in response to the digital signal as its input. This binary output starts increasing continuously with time. The output of the D/A converter also starts increasing in steps. The analog output is a staircase signal as shown in fig.</p> <p>This D/A output is fed to the reference voltage for the comparator. The staircase signal (i.e. digital output) is compared by the comparator with the analog voltage. So long as the input signal, V_s is greater than the digital output the gate remains enabled and clock pulses are counted by the counter, thus continuously raising the digital output. But as soon as the staircase digital output exceeds the given analog input, the output of the comparator changes from a low to a high level. This makes $R = 1$, while S is at 0. Thus, the flip-flop resets and Y output goes low. Hence the AND gate is disabled and no clock pulses can now reach the counter. This stops the counting and the binary output of the counter represents the final digital output.</p>	<p><i>Explanation</i> 2M</p>
(c) Ans.	<p>(ii) What are advantages and disadvantages of DAC? For Weighted Resistor DAC:</p> <p>Advantages:</p> <ol style="list-style-type: none"> 1. Simple circuit. 2. Easy calculations <p>Dis-Advantages:</p> <ol style="list-style-type: none"> 1. The accuracy and stability of this type of DAC depends upon the accuracy of the resistors used. 2. This type of DAC requires a wide range of resistor values. If the no. of digits n per binary word is 8 then the smallest resistor is $2^0 \times R = R\Omega$, while the largest resistance is $2^7 R = 128R \Omega$. Thus the 	<p>4M</p> <p style="text-align: right;"><i>Advantages</i> 2M</p> <p style="text-align: right;"><i>Disadvantages</i> 2M</p>
