(ISO/IEC - 27001 - 2005 Certified)

WINTER – 2016 EXAMINATION

Model Answer

Subject Code: 17333

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q.N o.	Sub Q.N.	Answer	Marking Scheme
1.	a) i)	Attempt any six of the following: Define w.r.t. digital IC's 1) Nosie Immunity 2) Propagation delay.	12 2M
	Ans.	1) Noise Immunity: The ability of a digital circuit to tolerate noise signals is called as noise immunity of a circuit. 2) Propagation delay: Propagation delay is the average transition delay time for the signal to propagate from input to output when the signals change in value. It is expressed in ns.	<i>Noise Immunity 1M</i> <i>Propagation delay 1M</i>
	ii)	State advantages of digital systems (any 4).	2M
	Ans.	Advantages of digital systems: <ul style="list-style-type: none">• The devices used in digital systems generally operate in one of the two states, known as ON and OFF resulting in a very simple operation.• A large number of ICs are available for performing various operations. These are highly reliable, accurate, small in size and the speed of operation is very high. A number of programmable ICs are also available.• The effect of fluctuations in the characteristics of the components,	<i>Any four advantages 1/2M each</i>

WINTER – 2016 EXAMINATION

Model Answer

Subject Code: 17333

		The number of bits accepted at the input can itself be used as the resolution. For example, an 8-bit D/A converter has an 8-bit resolution.	
		2) Conversion time: Total time required to convert analog input signal into corresponding digital output.	1M
1.	b)	Attempt any two of following:	8
	i)	Subtract using 2's complement method	4M
		1) $(10110)_2 - (10001)_2$	
		2) $(1101)_2 - (11010)_2$	
	Ans.	1) $(10110)_2 - (10001)_2$:	
		Step1: obtain 1's complement of $(10001)_2$	
		1's complement of 1 0 0 0 1 is 0 1 1 1 0	
		2's complement is 0 1 1 1 0	
		$ \begin{array}{r} + \quad \quad \quad 1 \\ \hline 2's \text{ complement } \quad 0 \ 1 \ 1 \ 1 \ 1 \end{array} $	2M
		Step 2: Add 10110 & 2's complement obtained in step1	
		$ \begin{array}{r} 1 \ 0 \ 1 \ 1 \ 0 \\ 0 \ 1 \ 1 \ 1 \ 1 \\ \hline 1 \ 1 \ 1 \\ \hline \text{carry} \rightarrow \boxed{1} \ 0 \ 0 \ 1 \ 0 \ 1 \end{array} $	
		Hence carry is 1 Answer is in positive form. Discarding carry	
		$(10110)_2 - (10001)_2 : (00101)_2$	
		2) $(1101)_2 - (11010)_2$:	
		Make no. of bits equal 01101-11010	
		Step 1: Find 2's complement of $(11010)_2$	
		1's complement of 1 1 0 1 0 is 0 0 1 0 1	
		2's complement is 0 0 1 0 1	
		$ \begin{array}{r} + \quad \quad \quad 1 \\ \hline 2's \text{ complement } \quad 0 \ 0 \ 1 \ 1 \ 0 \end{array} $	2M
		Step 2: Add $(01101)_2$ & 2's complement of (11010) from step 1.	
		$ \begin{array}{r} 0 \ 1 \ 1 \ 0 \ 1 \\ 0 \ 0 \ 1 \ 1 \ 0 \\ \hline 1 \ 1 \\ \hline \text{carry} \rightarrow \boxed{0} \ 1 \ 0 \ 0 \ 1 \ 1 \end{array} $

WINTER – 2016 EXAMINATION

Model Answer

Subject Code: 17333

<p>e) Ans.</p>	<p>Explain different triggering methods. There are four types of pulse-triggering methods: 1. Positive (High) Level Triggering: When a flip flop is required to respond at its HIGH state a HIGH level triggering method is used. It is mainly identified from the straight lead from the clock input. Take a look at the symbolic representation shown below.</p> <p style="text-align: center;">Triggers on high clock level</p>  <p style="text-align: center;">High Level Triggering</p> <p>2. Negative (Low) Level Triggering: When a flip flop is required to respond at its LOW state, a LOW level triggering method is used. It is mainly identified from the clock input lead along with a low state indicator bubble. Take a look at the symbolic representation shown below.</p> <p style="text-align: center;">Triggers on low clock level</p>  <p style="text-align: center;">Low Level Triggering</p> <p>3. Positive Edge Triggering: When a flip flop is required to respond at a LOW to HIGH transition state, POSITIVE edge triggering method is used. It is mainly identified from the clock input lead along with a triangle. Take a look at the symbolic representation shown below.</p> <p style="text-align: center;">Triggers on this edge of the clock pulse</p>  <p style="text-align: center;">Positive Edge Triggering</p>	<p style="text-align: center;">4M</p> <p style="text-align: center;"><i>Four triggering Method: 1M each</i></p>

Model Answer

Subject Code: 17333

		<p>4. Negative Edge Triggering: When a flip flop is required to respond during the HIGH to LOW transition state, a NEGATIVE edge triggering method is used. It is mainly identified from the clock input lead along with a low-state indicator and a triangle.</p>  <p align="center">Negative Edge Triggering</p>	
<p>f) Ans.</p>		<p>Explain Master-Slave JK flip-flop with neat diagram.</p> <p>Master-Slave JK Flip-flop: It is two gated SR flip-flops connected together in a series configuration with the slave having an inverted clock pulse. The outputs from Q and Q from the “Slave” flip-flop are fed back to the inputs of the “Master” with the outputs of the “Master” flip flop being connected to the two inputs of the “Slave” flip flop.</p>  <p>The input signals J and K are connected to the gated “master” SR flip flop which “locks” the input condition while the clock (Clk) input is “HIGH” at logic level “1”. As the clock input of the “slave” flip flop is the inverse (complement) of the “master” clock input, the “slave” SR flip flop does not toggle. The outputs from the “master” flip flop are only “seen” by the gated “slave” flip flop when the clock input goes “LOW” to logic level “0”.</p> <p>When the clock is “LOW”, the outputs from the “master” flip flop are latched and any additional changes to its inputs are ignored. The gated “slave” flip flop now responds to the state of its inputs passed over by the “master” section.</p>	<p align="right">4M</p> <p align="right">Diagram : 2M</p> <p align="right">Explanation: 2M</p>

	<p>b) Ans.</p>	<p>State any four specification of ADC</p> <p>Resolution: The resolution refers to the finest minimum change in the signal which is accepted for conversion and it is decided with respect to number of bits. It is given as $1/2^n$, where n is the number of bits in the digital output word. As it is clear, that the resolution can be improved by increasing the number of bits or the number of bits representing the given analog input voltage. Resolution can also be defined as the ratio of change in the value of input voltage V_i, needed to change the digital output by 1 LSB.</p> <p>It is given as</p> $\text{Resolution} = V_{IFS} / (2^n - 1)$ <p>Where 'V_{IFS}' is the full-scale input voltage. 'n' is the number of output bits.</p> <p>Quantization error: If the binary output bit combination is such that for all the values of input voltage V_i between any two voltage levels, there is a unavoidable uncertainty about the exact value of V_i when the outputs a particular binary combination. This uncertainty is termed as quantization error.</p> <p>It is given as,</p> $Q_E = V_{IFS} / 2(2^n - 1)$ <p>Where 'V_{IFS}' is the full-scale input voltage 'n' is the number of output bits.</p> <p>Linearity Error: It is defined as the measure of variation in voltage step size. It indicates the difference between the transitions for a minimum step of input voltage change. This is normally specified as fraction of LSB.</p> <p>DNL (Differential Non-Linearity) Error: The analog input levels that trigger any two successive output codes should differ by 1 LSB. Any deviation from this 1 LSB value is called as DNL error.</p> <p>INL (Integral Non-Linearity Error): The deviation of characteristics of an ADC due to missing codes causes INL error. The maximum deviation of the code from its ideal value after nulling the offset and</p>	<p>4M</p> <p><i>Any 4 Specific ations: 1M each</i></p>

Model Answer

Subject Code: 17333

OR

Method 2 Using 10's Complement method

Step i) Obtain 10's Complement of $(36)_{BCD}$

→ obtain 9's Complement

→ add 1 to 9's Complement

$$\begin{array}{r} 9's \text{ complement} = 99 \\ - 36 \\ \hline 63 \\ + 1 \\ \hline 10's \text{ comp} = (64) \end{array}$$

Step ii) Add $(86)_{BCD}$ to 10's Complement of $(36)_{BCD}$

$$\begin{array}{r} \therefore (86)_{BCD} = 1000 \ 0110 \\ + (64)_{BCD} = 0110 \ 0100 \\ \hline 1110 \ 1010 \\ \hline \text{Invalid BCD} \quad \text{Invalid BCD} \end{array}$$

Step iii) Convert Invalid to valid by adding $(6)_{BCD}$

$$\begin{array}{r} \therefore \begin{array}{r} 1110 \ 1010 \\ + 0110 \ 0110 \\ \hline 10100 \ 10000 \\ \hline \text{discard} \quad 5 \quad 0 \end{array} \end{array}$$

$$\therefore (86)_{BCD} - (36)_{BCD} = (50)_{BCD}$$

b) Ans.	Draw the logic diagram of D. flipflop using NAND gates. Write its truth table.	4M

Model Answer

Subject Code: 17333

HIGH, logic “1” allowing the flip-flop to toggle on every clock pulse. Then the synchronous counter follows a predetermined sequence of states in response to the common clock signal, advancing one state for each pulse.

The J and K inputs of flip-flop FFB are connected directly to the output Q_A of flip-flop FFA, but the J and K inputs of flip-flops FFC and FFD are driven from separate AND gates which are also supplied with signals from the input and output of the previous stage. These additional AND gates generate the required logic for the JK inputs of the next stage.

If we enable each JK flip-flop to toggle based on whether or not all preceding flip-flop outputs (Q) are “HIGH” we can obtain the same counting sequence as with the asynchronous circuit but without the ripple effect, since each flip-flop in this circuit will be clocked at exactly the same time.

Then as there is no inherent propagation delay in synchronous counters, because all the counter stages are triggered in parallel at the same time, the maximum operating frequency of this type of frequency counter is much higher than that for a similar asynchronous counter circuit.

Model Answer

Subject Code: 17333

A_n	B_n	C_{n-1}	Sum S_n	Carry C_n
0	0	0	0	0
0	0	1	1	0
0	1	0	1	0
0	1	1	0	1
1	0	0	1	0
1	0	1	0	1
1	1	0	0	1
1	1	1	1	1

Truth table 1M

For the sum output

(a) : K-map for sum output

Expression for sum output

$$S = \overline{A} \overline{B} C_{in} + \overline{A} B C_{in} + A \overline{B} \overline{C_{in}} + A B \overline{C_{in}}$$

$$S = C_{in} (\overline{A} \overline{B} + \overline{A} B + A \overline{B} + A B) + \overline{C_{in}} (\overline{A} \overline{B} + A B)$$

EX-NOR EX-OR

$$\therefore S = C_{in} (\overline{A} \overline{B} + \overline{A} B + A \overline{B} + A B) + \overline{C_{in}} (\overline{A} \overline{B} + A B)$$

Let $X = \overline{A} \overline{B} + \overline{A} B + A \overline{B} + A B$

$$\therefore S = C_{in} X + \overline{C_{in}} X = C_{in} \oplus X$$

$$\therefore S = C_{in} \oplus (\overline{A} \overline{B} + \overline{A} B + A \overline{B} + A B)$$

But $\overline{A} \overline{B} + \overline{A} B + A \overline{B} + A B = A \oplus B$

$$\therefore S = C_{in} \oplus A \oplus B$$

Expression for carry output

$$C_o = AB + AC_{in} + BC_{in}$$

6.	b) i) Ans.	Differentiate combinational and sequential logic circuits (2pts).		2M Any 2 points 1M each
		Sr. No.	Combinational circuits	
		1	In combinational circuits, the output variables depends on the combinational of input variables.	In sequential circuits, the output variables depends upon the present inputs as well as on the past output.
		2	Memory unit is not required in these circuits.	Memory unit is required in these circuits to store the previous output.
		3	These circuits are faster in speed because the delay between the input and output is due to the propogation delay.	Sequential circuits are slower than the combinational circuits.
		4	These are easy to design.	These are complex in designing.
		5	Ex: Parallel Adder.	Ex: Serial Adder.
	ii) Ans.	State the applications of shift registers.		2M Any 2 applications 1M each
		<ul style="list-style-type: none"> • For temporary data storage. • For multiplication and division. • Parallel to serial converter. • Ring counter. 		
	iii) Ans.	Draw the block diagram of 4-bit PIPO shift register and explain its working with timing diagram.		4M Explanation 1M
		<p>In this register, the input is given in parallel and the output also collected in parallel. The clear (CLR) signal and clock signals are connected to all the 4 flip flops. Data is given as input separately for each flip flop and in the same way, output also collected individually from each flip flop.</p>		Logical diagram 2M
